Regulatory and Legal

Si ce produit est vendu au Canada, vous pouvez accéder à ce document en français canadien à <https://www.netgear.com/support/download/>.

(If this product is sold in Canada, you can access this document in Canadian French at <https://www.netgear.com/support/download/>.)

For regulatory compliance information including the EU Declaration of Conformity, visit <https://www.netgear.com/about/regulatory/>.

See the regulatory compliance document before connecting the power supply.

For NETGEAR's Privacy Policy, visit <https://www.netgear.com/about/privacy-policy>.

By using this device, you are agreeing to NETGEAR's Terms and Conditions at <https://www.netgear.com/about/terms-and-conditions>. If you do not agree, return the device to your place of purchase within your return period.

Do not use this device outdoors.

Applicable to 6 GHz devices only: Only use the device indoors. The operation of 6 GHz devices is prohibited on oil platforms, cars, trains, boats, and aircraft, except that operation of this device is permitted in large aircraft while flying above 10,000 feet. Operation of transmitters in the 5.925-7.125 GHz band is prohibited for control of or communications with unmanned aircraft systems.

Revision History

Publication Part Number	Publish Date	Comments
202-12642-01	December 2022	We published the manual in a new format, added multiple sections, and made multiple corrections.

Contents

Chapter 1 Hardware Setup

- Unpack your router.....10
- LEDs and buttons on the top panel.....10
- Rear panel.....12
- Label.....13
- Position your router.....13
- Cable your router.....14
- Wall-mount your router.....15

Chapter 2 Connect to the network and access the router

- Connect to the router network.....17
 - Connect to the router using a wired connection.....17
 - Connect to the router WiFi network.....17
 - Connect to the WiFi network using WPS.....17
- Types of logins.....18
- Use a web browser to access the router.....18
 - Automatic Internet setup.....18
 - Log in to the router.....20
- Change the language.....20
- Install and manage your router with the Nighthawk app.....21

Chapter 3 Specify Your Internet Settings

- Use the Internet Setup Wizard.....24
- Manually set up the Internet connection.....24
 - Specify an Internet connection without a login.....24
 - Specify an Internet connection that uses a login and PPPoE service.....26
 - Specify an Internet connection that uses a login and PPTP or L2TP service.....27
- Specify IPv6 Internet connections.....29
 - Requirements for entering IPv6 addresses.....30
 - Use Auto Detect for an IPv6 Internet connection.....30
 - Set up an IPv6 6to4 tunnel Internet connection.....31
 - Set up an IPv6 pass-through Internet connection.....33
 - Set up a fixed IPv6 Internet connection.....33
 - Set up an IPv6 DHCP Internet connection.....34

Set up an IPv6 PPPoE Internet connection.....36
Use Auto Config for an IPv6 Internet connection.....38
Set up an IPv6 6rd tunnel connection.....39
Change the MTU size.....41

Chapter 4 Control Access to the Internet

Activate Armor using the Nighthawk app.....43
Enable Circle Smart Parental Controls using the Nighthawk app.43
Network access control list.....43
 Enable the network access control list, set the access rule, and
 allow or block connected devices.....44
 Manage allowed devices currently not on the network.....46
 Manage blocked devices currently not on the network.....48
Use keywords to block Internet sites.....49
Delete keywords from the blocked list.....51
Block services from the Internet.....51
Prevent blocking on a trusted computer.....53
Schedule when to block Internet sites and services.....53
Set up security event email notifications.....54

Chapter 5 Network Settings

View or change the WAN settings.....57
Set up a default DMZ server.....58
Change the router’s device name.....59
Change the LAN TCP/IP settings.....59
Specify the IP addresses that the router assigns.....61
Disable the DHCP server feature in the router.....62
Manage reserved LAN IP addresses.....63
 Reserve an IP address.....63
 Edit a reserved IP address.....64
 Delete a reserved IP address entry.....64
Use the WPS Wizard for WiFi connections.....65
Specify basic WiFi settings.....66
Change the WiFi Mbps Settings.....67
Change the WiFi password or the WiFi security.....68
Configure WPA/WPA2 Enterprise WiFi security.....70
Set up a guest WiFi network.....71
Control the WiFi radios.....73
 Use the WiFi On/Off button.....74
 Enable or disable the WiFi radios.....74
Set up a WiFi schedule.....75
Specify WPS settings.....75
Set up the router as a WiFi access point.....76
Set up a Bridge for a Port Group or VLAN Tag Group.....78

Nighthawk AC1750 Smart WiFi Router

Set Up a Bridge for a Port Group.....	78
Set Up a Bridge for a VLAN Tag Group.....	79
Set Up an IPTV Port to Lease an Intranet Port.....	80
Manage custom static routes.....	81
Set up a static route.....	82
Edit a static route.....	83
Delete a static route.....	84
Improve network connections with Universal Plug and Play.....	85
Manage advanced WiFi settings.....	86
Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio.....	86
Enable or disable implicit beamforming.....	87
Enable or disable airtime fairness.....	87
Enable bridge mode.....	88
Change the CTS/RTS threshold or preamble mode for a radio.....	90

Chapter 6 Optimize Performance

Optimize Internet gaming with upstream QoS.....	93
Add upstream QoS priority rules.....	94
Set up an upstream QoS rule for an application or online game.....	94
Set up an upstream QoS rule for a router LAN port.....	95
Set up an upstream QoS rule for a MAC address.....	96
Change an upstream QoS policy rule.....	97
Delete an upstream QoS policy rule.....	98
Delete all upstream QoS policy rules.....	98
Optimize video streaming with downstream QoS.....	99
Add downstream QoS priority rules.....	100
Add a downstream QoS policy rule by keyword.....	100
Add a downstream QoS policy rule by MAC address.....	101
Change a downstream QoS policy rule.....	102
Delete a downstream QoS policy rule.....	102
Delete all downstream QoS policy rules.....	103
Manage Wi-Fi Multimedia Quality of Service.....	103

Chapter 7 Manage Your Router

Update the router firmware.....	106
Check for new firmware and update the router.....	106
Manually upload firmware to the router.....	107
Change the admin Password.....	108
Enable admin password reset.....	108
Reset the admin password.....	109
Always use HTTPS to access the router.....	110
View Devices Currently on the Network.....	111

Nighthawk AC1750 Smart WiFi Router

Manage the Router Configuration File.....	111
Back Up Settings.....	112
Erase the Current Configuration Settings.....	112
Restore Configuration Settings.....	113
Return the router to its factory default settings.....	113
Use the Reset button.....	114
Erase the settings.....	114
View the Status and Statistics of the Router.....	115
View information about the router and the Internet and WiFi settings.....	115
Display the statistics of the Internet port.....	116
Check the Internet connection status.....	117
Manage the Activity Log.....	118
View, Email, or Clear the Logs.....	118
Specify Which Activities Are Logged.....	119
Monitor and Meter Internet Traffic.....	120
Start the Traffic Meter Without Traffic Volume Restrictions....	120
Restrict Internet Traffic by Volume.....	121
Restrict Internet Traffic by Connection Time.....	122
View the Internet Traffic Volume and Statistics.....	123
Unblock the Traffic Meter After the Traffic Limit Is Reached..	124
Set the NTP server.....	124
Set your time zone and daylight saving time.....	125
Connect to your router with Anywhere Access.....	126
Disable or Enable LED Blinking or Turn Off LEDs.....	126

Chapter 8 Share USB Storage Devices Attached to the Router

USB device requirements.....	129
Connect a USB storage device to the router.....	129
Access a storage device connected to the router.....	130
Access a storage device connected to the router from a Windows-based computer.....	130
Access a storage device that is connected to the router from a Mac.....	130
Map a USB device to a Windows network drive.....	131
Back up Mac computers with Time Machine.....	132
Set up a USB hard drive on a Mac.....	132
Prepare to back up a large amount of data.....	133
Use Time Machine to back up onto a USB hard disk.....	134
Manage Access to a Storage Device.....	135
Approve a USB storage device.....	137
Enable FTP access within your network.....	138
View network folders on a storage device.....	138
Add a network folder on a USB storage device.....	139

Edit a network folder on a USB storage device.....	140
Safely remove a USB storage device.....	141
Chapter 9 Use Dynamic DNS to Access USB Storage Devices Through the Internet	
Set up and manage Dynamic DNS.....	143
Set up FTP access through the Internet.....	143
Your personal FTP server.....	144
Set up your personal FTP server.....	144
Set up a new Dynamic DNS account.....	145
Specify a DNS account that you already created.....	146
Change the Dynamic DNS settings.....	147
Access USB storage devices through the Internet.....	147
Remotely access a USB device using ReadyCLOUD.....	148
Create a ReadyCLOUD account.....	148
Register your router with ReadyCLOUD.....	149
Chapter 10 Use the Router as a Media Server	
Specify ReadyDLNA Media Server Settings.....	152
Play Music From a Storage Device With iTunes Server.....	153
Set Up the Router's iTunes Server With iTunes.....	153
Set Up the Router's iTunes Server With the Remote App.....	154
Set Up the Router to Work With TiVo.....	155
Chapter 11 Share a USB Printer	
Install the printer driver and cable the printer.....	158
Download the ReadySHARE printer utility.....	158
Install the ReadySHARE printer utility.....	158
Print using the NETGEAR USB Control Center.....	159
Chapter 12 Use OpenVPN to Access Your Network	
About VPN connections.....	162
LAN IP addressing in VPN networks.....	162
Enable OpenVPN service in the router.....	163
Install OpenVPN software on a VPN client.....	164
Install OpenVPN software on a Windows-based computer....	165
Install OpenVPN software on a Mac computer.....	166
Install OpenVPN software on an iOS device.....	167
Install OpenVPN software on an Android device.....	168
Use VPN to access your Internet service at home.....	169
Allow VPN client Internet access in the router.....	169
Block VPN client Internet access in the router.....	170
Use VPN to remotely access a USB storage device attached to the router.....	171

Chapter 13 Manage port forwarding and port triggering

Manage port forwarding to a local server.....173
 Set up port forwarding to a local server.....173
 Add a custom port forwarding service.....174
 Edit a port forwarding service.....175
 Delete a port forwarding entry.....176
 Application example: Make a local web server public.....176
 How the router implements the port forwarding rule.....177
Port triggering.....177
 Add a port triggering service.....178
 Enable port triggering.....179
 Application example: Port triggering for Internet relay chat port triggering.....179

Chapter 14 Troubleshooting

Quick tips.....182
 Sequence to restart your network.....182
 Check the power adapter and Ethernet cable connections...182
 Check the WiFi settings.....182
 Check the network settings.....182
Troubleshoot with the LEDs.....183
 Standard LED behavior when the router is powered on.....183
 Power LED is off or blinking.....183
 LEDs never turn off.....183
 Internet or Ethernet LAN port LEDs are off.....184
 WiFi LED is off.....184
You cannot log in to the router.....184
You cannot access the Internet.....185
Troubleshoot Internet browsing.....187
Changes are not saved.....187
Troubleshoot WiFi connectivity.....188
Troubleshoot your network using the ping utility.....188
 Test the LAN path to your router.....188
 Test the path from a Windows-based computer to a remote device.....189

Appendix A Supplemental Information

Factory Settings.....192
Technical Specifications.....193

1

Hardware Setup

This chapter contains the following sections:

- [Unpack your router](#)
- [LEDs and buttons on the top panel](#)
- [Rear panel](#)
- [Label](#)
- [Position your router](#)
- [Cable your router](#)
- [Wall-mount your router](#)

For more information about the topics covered in this manual, visit the support website at netgear.com/support.

Unpack your router

Your package contains the router, power adapter, and an Ethernet cable.

Figure 1. Package contents

LEDs and buttons on the top panel

The status LEDs, **WiFi On/Off** button, and **WPS** button are located on the top panel of the router.

Figure 2. Router LEDs and buttons

Nighthawk AC1750 Smart WiFi Router

The following table describes the LEDs and buttons on the top of the router.

Table 1. LED descriptions

LED	Description
Power 	<ul style="list-style-type: none">• Solid white. The router is ready.• Blinking white. The router is not ready, the firmware is upgrading, or the Reset button was pressed.• Off. Power is not supplied to the router.
Internet 	<ul style="list-style-type: none">• Solid white. An Ethernet connection is established.• Blinking white. The port is sending or receiving traffic.• Off. No Ethernet cable is connected between the router and the modem.
2.4 GHz WiFi 2.4 GHz	<ul style="list-style-type: none">• Solid white. The 2.4 GHz WiFi radio is operating.• Blinking. The router is sending or receiving WiFi traffic.• Off. The 2.4 GHz WiFi radio is off.
5 GHz WiFi 5 GHz	<ul style="list-style-type: none">• Solid white. The 5 GHz WiFi radio is operating.• Blinking. The router is sending or receiving WiFi traffic.• Off. The 5 GHz WiFi radio is off.
Guest WiFi Guest WiFi	<p>Guest WiFi network allows visitors at your home to use the Internet without using your WiFi security key. You can add a guest network for 2.4 GHz WiFi band and 5 GHz WiFi band.</p> <ul style="list-style-type: none">• Solid white. The guest WiFi network is operating.• Off. The guest WiFi network is off.
USB 3.0 port USB 3.0	<p>The USB 3.0 LED is for the USB 3.0 USB port.</p> <ul style="list-style-type: none">• Solid white. A USB device is connected and is ready.• Blinking. A USB device is plugged in and is trying to connect.• Off. No USB device is connected, or someone clicked the Safely Remove Hardware button and it is now safe to remove the attached USB device.
Ethernet ports 1-4 1 2 3 4	<p>The LED color indicates the speed: white for Gigabit Ethernet connections and amber for 100 Mbps or 10 Mbps Ethernet connections.</p> <ul style="list-style-type: none">• Solid. A powered-on device is connected to the Ethernet port.• Blinking. The port is sending or receiving traffic.• Off. No device is connected to this Ethernet port.

Table 1. LED descriptions (Continued)

LED	Description
WiFi On/Off button with LED 	Pressing this button for two seconds turns the 2.4 GHz and 5 GHz WiFi radios on and off. If this LED is lit, the WiFi radios are on. If this LED is off, the WiFi radios are turned off and you cannot use WiFi to connect to the router.
WPS button with LED 	This button lets you use WPS to join the WiFi network without typing the WiFi password. The WPS LED blinks white during this process and then lights solid white.

Rear panel

The rear panel connections and buttons are shown in the following figure.

Figure 3. Rear panel

Viewed from left to right, the rear panel contains the following components:

- **Reset button.** Press the **Reset** button for at least seven seconds to reset the router. The Power LED blinks white and the router returns to its factory settings.
- **Ethernet ports.** Use the four Gigabit Ethernet RJ-45 LAN ports to connect the router to LAN devices. Ethernet port aggregation is enabled by default. Use Ethernet aggregate ports 1 and 2 to cable a device that supports Ethernet port aggregation to the router. Ethernet ports 3 and 4 are nonaggregate Ethernet ports.
- **WAN port.** Use the yellow Gigabit Ethernet RJ-45 WAN Internet port to connect the router to a modem.
- **Power On/Off button.** Press the **Power On/Off** button to provide power to the router.
- **DC power connector.** Connect the power adapter that came in the product package to the DC power connector.

Label

The label on the router shows the login information, WiFi Network Name (SSID), network key (Password), serial number, and MAC address.

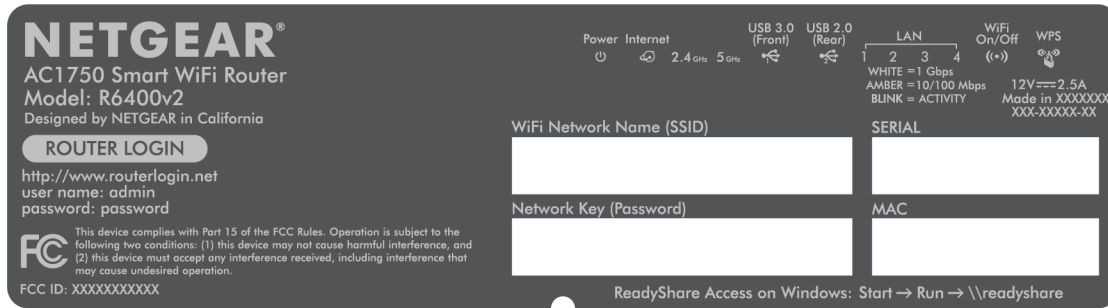

Figure 4. Product label

Position your router

The router lets you access your network anywhere within the operating range of your WiFi network. However, the operating distance or range of your WiFi connection can vary significantly depending on the physical placement of your router.

In addition, position your router according to the following guidelines:

- Place your router near the center of the area where your computers and other devices operate, and within line of sight to your WiFi devices.
- Make sure that the router is within reach of an AC power outlet and near Ethernet cables for wired computers.
- Place the router in an elevated location, minimizing the number walls and ceilings between the router and your other devices.
- Place the router away from electrical devices such as these:
 - Ceiling fans
 - Home security systems
 - Microwaves
 - Computers
 - Base of a cordless phone
 - 2.4 GHz and 5 GHz cordless phones

Nighthawk AC1750 Smart WiFi Router

- Place the router away from large metal surfaces, large glass surfaces, insulated walls, and items such as these:
 - Solid metal door
 - Aluminum studs
 - Fish tanks
 - Mirrors
 - Brick
 - Concrete

The following factors might limit the range of your WiFi:

- The thickness and number of walls the WiFi signal passes through can limit the range..
- Other WiFi access points in and around your home might affect your router's signal. WiFi access points are routers, repeaters, WiFi range extenders, and any other device that emit a WiFi signal for network access.

Cable your router

Power on your router and connect it to a modem.

Figure 5. Cable your router

To cable your router:

1. Unplug your modem's power, leaving the modem connected to the wall jack for your Internet service.
If your modem uses a battery backup, remove the battery.
2. Plug in and turn on your modem.

Nighthawk AC1750 Smart WiFi Router

If your modem uses a battery backup, put the battery back in.

3. Connect your modem to the Internet port of your router with the Ethernet cable that came with your router.
4. Connect the power adapter to your router and plug the power adapter into an outlet.
5. Press the **Power On/Off** button on the rear panel of the router.

Wall-mount your router

Wall-mounting holes on the bottom let you wall-mount your router.

Figure 6. Bottom of the router

Note: We recommend using pan head Phillips wood screws, 3.5 x 20 mm (diameter x length, European) or No. 6 type screw, 1 inch long (U.S.).

To wall-mount your router:

1. Drill holes in the wall where you want to wall-mount your router.
2. Insert wall anchors in the holes.
3. Insert screws into the wall anchors, leaving 3/16 inch (0.5 cm) of each screw exposed.
4. Align the router's wall-mounting holes with the screws and mount your router.

2

Connect to the network and access the router

You can connect to the router's WiFi networks or use a wired Ethernet connection. This chapter explains the ways you can connect and how to access the router and log in.

The chapter contains the following sections:

- [Connect to the router network](#)
- [Types of logins](#)
- [Use a web browser to access the router](#)
- [Change the language](#)
- [Install and manage your router with the Nighthawk app](#)

Connect to the router network

You can connect to the router network using a wired, WiFi, or WPS connection.

Note: If you set up your computer to use a static IP address, change the settings so that it uses Dynamic Host Configuration Protocol (DHCP).

Connect to the router using a wired connection

You can connect your computer to the router using an Ethernet cable and join the router's local area network (LAN).

To connect your computer to the router with an Ethernet cable:

1. Make sure that the router is receiving power (its Power LED is lit).
2. Connect an Ethernet cable to an Ethernet port on your computer.
3. Connect the other end of the Ethernet cable to an Ethernet port on the router.
Your computer connects to the local area network (LAN).

Connect to the router WiFi network

You can connect WiFi-enabled devices to the router WiFi network using the router WiFi network name and password.

To connect to the WiFi network:

1. Make sure that the router is receiving power (its Power LED is lit).
2. On your WiFi-enabled device, open your device's WiFi network management settings.
3. Find and select the router WiFi network name (SSID).
The router WiFi network name (SSID) is on the router label.
4. Enter the router network key (password).
The router network key (password) is on the router label.
Your device connects to the WiFi network.

Connect to the WiFi network using WPS

You can connect WPS-enabled devices to the router's WiFi network with Wi-Fi Protected Setup (WPS). Your router has a **WPS** button that you can use to connect WPS-enabled devices.

To use WPS to connect to the WiFi network:

1. Make sure that the router is receiving power (its Power LED is lit).
2. Check the WPS instructions for your WPS-enabled device.
3. Press the **WPS** button on the router.
4. Within two minutes, on your WPS-enabled device, press its **WPS** button or follow its instructions for how to connect using WPS.
Your WPS-enabled device connects to the WiFi network.

Types of logins

Separate types of logins serve different purposes. It is important that you understand the differences so that you know which login to use when.

Several types of logins are associated with the router:

- **ISP login.** The login that your Internet service provider (ISP) gave you logs you in to your Internet service. Your ISP gave you this login information in a letter or some other way. If you cannot find this login information, contact your ISP.
- **WiFi network key, WiFi passphrase, or WiFi password.** Your router is preset with a unique WiFi network name (SSID) and password for WiFi access. This information is on the router label.
- **NETGEAR account login.** The free NETGEAR account that you need to register your router and manage your subscriptions. If you do not own a NETGEAR account, you can create one.
- **Router login.** The router login password that you need to log in to the router with the admin user name when you use a web browser to access the router.

Use a web browser to access the router

When you connect to the network (either with WiFi or with an Ethernet cable), you can use a web browser to access the router to view or change its settings. When you access the router, the software automatically checks to see if your router can connect to your Internet service.

Automatic Internet setup

You can set up your router automatically, or you can use a web browser to access the router and set up your router manually. Before you start the setup process, get your ISP

information and make sure that the computers and devices in the network are using the settings described here.

When your Internet service starts, your Internet service provider (ISP) typically gives you all the information needed to connect to the Internet. For DSL service, you might need the following information to set up your router:

- The ISP configuration information for your DSL account
- ISP login name and password
- Fixed or static IP address setting (special deployment by ISP; this setting is rare)

If you cannot locate this information, ask your ISP to provide it. When your Internet connection is working, you no longer need to launch the ISP login program on your computer to access the Internet. When you start an Internet application, your router automatically logs you in.

The NETGEAR installation assistant runs on any device with a web browser. Installation and basic setup takes about 15 minutes to complete.

To automatically set up your router:

1. Make sure that the router is powered on.
2. Make sure that your computer or mobile device is connected to the router with an Ethernet cable (wired) or over WiFi with the preset security settings listed on the label.

Note: If you want to change the router's WiFi settings, use a wired connection to avoid being disconnected when the new WiFi settings take effect.

3. Launch a web browser.

The page that displays depends on whether you accessed the router before:

- The first time you set up the Internet connection for your router, the browser goes to **<http://www.routerlogin.net>** and the Configuring the Internet Connection page displays.
- If you already set up the Internet connection, enter **<http://www.routerlogin.net>** in the address field for your browser to start the installation process.

4. Follow the onscreen instructions.

The router connects to the Internet.

5. If the browser does not display the NETGEAR installation assistant, do the following:

- Make sure that the computer is connected to one of the LAN Ethernet ports or over WiFi to the router.
- Make sure that the router is receiving power and that its Power LED is lit.

- Close and reopen the browser or clear the browser cache.
 - Browse to **http://www.routerlogin.net**.
 - If the computer is set to a static or fixed IP address (this setting is uncommon), change it to obtain an IP address automatically from the router.
6. If the router does not connect to the Internet, do the following:
 - a. Review your settings. Make sure that you selected the correct options and typed everything correctly.
 - b. Contact your ISP to verify that you are using the correct configuration information.
 - c. Read [You cannot access the Internet](#) on page 185. If problems persist, register your router and contact NETGEAR Technical Support.

Log in to the router

When you first connect to your router and launch a web browser, the browser automatically displays the router web interface. If you want to view or change settings for the router later, you can use a browser to log in to the router web interface.

To log in to the router:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

Note: You can also enter **http://www.routerlogin.com** or **http://192.168.1.1**. The procedures in this manual use **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

Change the language

By default, the language that displays when you log in to the router web interface is set to Auto.

To change the language:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. In the upper right corner, select a language from the menu.
5. When prompted, click the **OK** button to confirm this change.
The page refreshes with the language that you selected.

Install and manage your router with the Nighthawk app

With the Nighthawk app, you can easily install and manage your router. The app automatically updates the router to the latest firmware, allows you to personalize your WiFi network, and even helps register your router with NETGEAR.

The Nighthawk app is available for iOS and Android mobile devices.

Note: Your router is not connected to the Internet until you finish setting it up with the app. If you are connected to your router's WiFi network before the setup, you do not have Internet access and cannot download the app.

Use your cellular data or connect to your previous router's WiFi network to download the app. During the installation, the app instructs you when you need to connect to your router's WiFi.

To install your router using the Nighthawk app:

1. Visit Nighthawk-app.com to download the Nighthawk app.

Note: To download the app, you need to use your cellular data or connect your mobile device to your previous router's WiFi network.

2. Wait for the Nighthawk app to download on your mobile device.

Nighthawk AC1750 Smart WiFi Router

3. Launch the Nighthawk app.
4. Follow the instructions that display in the app to install your router and connect to the Internet.

3

Specify Your Internet Settings

Usually, the quickest way to set up the router to use your Internet connection is to allow your router to detect the Internet connection automatically when you first access the router web interface. You can also customize and manually specify your Internet settings.

This chapter contains the following sections:

- [Use the Internet Setup Wizard](#)
- [Manually set up the Internet connection](#)
- [Specify IPv6 Internet connections](#)
- [Change the MTU size](#)

Use the Internet Setup Wizard

You can use the Setup Wizard to detect your Internet settings and automatically set up your router. The Setup Wizard is not the same as the pages that display the first time you connect to your router to set it up.

To use the Setup Wizard:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup Wizard**.
The Setup Wizard page displays.
5. Select the **Yes** radio button.
If you select the **No** radio button, you are taken to the Internet Setup page (see [Manually set up the Internet connection](#) on page 24).
6. Click the **Next** button.
The Setup Wizard searches your Internet connection for servers and protocols to determine your Internet configuration.

Manually set up the Internet connection

You can view or change the router's Internet connection settings.

Specify an Internet connection without a login

To specify the Internet connection settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Internet**.
The Internet Setup page displays.
5. In the Does your Internet connection require a login? section, leave the **No** radio button selected.
6. If your Internet connection requires an account name or host name, click the **Edit** button in the Account Name section and enter the account name.
7. If your Internet connection requires a domain name, type it in the **Domain Name (If Required)** field.
For the other sections on this page, the default settings usually work, but you can change them.
8. Select an Internet IP Address radio button:
 - **Get Dynamically from ISP**. Your ISP uses DHCP to assign your IP address. Your ISP automatically assigns these addresses.
 - **Use Static IP Address**. Enter the IP address, IP subnet mask, and the gateway IP address that your ISP assigned. The gateway is the ISP router to which your router connects.
9. Select a Domain Name Server (DNS) Address radio button:
 - **Get Automatically from ISP**. Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
 - **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.
10. Select a Router MAC Address radio button:
 - **Use Default Address**. Use the default MAC address.
 - **Use Computer MAC Address**. The router captures and uses the MAC address of the computer that you are now using. You must use the one computer that the ISP allows.
 - **Use This MAC Address**. Enter the MAC address that you want to use.
11. Click the **Apply** button.
Your settings are saved.

12. Click the **Test** button to test your Internet connection.

If the NETGEAR website does not display within one minute, see [You cannot access the Internet](#) on page 185.

Specify an Internet connection that uses a login and PPPoE service

You can manually specify the connection settings for a PPPoE Internet service for which you must log in. Use the information that your Internet service provider (ISP) gave you to connect to your Internet service. If you cannot find this information, contact your ISP. Entering incorrect information might prevent the router from connecting to the Internet.

To specify the connection settings for a PPPoE Internet service for which you must log in:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Internet**.
The Internet Setup page displays.
5. Select the Does your Internet connection require a login? **Yes** radio button.
The page adjusts.
6. From the **Internet Service Provider** menu, select **PPPoE** as the encapsulation method.
The page adjusts.
7. In the **Login** field, enter the login name that your ISP gave you.
This login name is often an email address.
8. In the **Password** field, type the password that you use to log in to your Internet service.
9. If your ISP requires a service name, type it in the **Service Name (if Required)** field.

10. From the **Connection Mode** menu, select **Always On, Dial on Demand**, or **Manually Connect**.

11. To change the number of minutes until the Internet login times out, in the **Idle Timeout (In minutes)** field, type the number of minutes.

This is how long the router keeps the Internet connection active when no one on the network is using the Internet connection. A value of 0 (zero) means never log out.

12. Select an Internet IP Address radio button:

- **Get Dynamically from ISP.** Your ISP uses DHCP to assign your IP address. Your ISP automatically assigns these addresses.
- **Use Static IP Address.** Enter the IP address, IP subnet mask, and the gateway IP address that your ISP assigned. The gateway is the ISP router to which your router connects.

13. Select a Domain Name Server (DNS) Address radio button:

- **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
- **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.

14. Select a Router MAC Address radio button:

- **Use Default Address.** Use the default MAC address.
- **Use Computer MAC Address.** The router captures and uses the MAC address of the computer that you are now using. You must use the one computer that the ISP allows.
- **Use This MAC Address.** Enter the MAC address that you want to use.

15. Click the **Apply** button.

Your settings are saved.

16. Click the **Test** button to test your Internet connection.

If the NETGEAR website does not display within one minute, see [You cannot access the Internet](#) on page 185.

Specify an Internet connection that uses a login and PPTP or L2TP service

You can manually specify the connection settings for a PPTP or L2TP Internet service for which you must log in. Use the information that your Internet service provider (ISP) gave you to connect to your Internet service. If you cannot find this information, contact

your ISP. Entering incorrect information might prevent the router from connecting to the Internet.

To specify the connection settings for a PPTP or L2TP Internet service for which you must log in:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Internet**.
The Internet Setup page displays.
5. Select the Does your Internet connection require a login? **Yes** radio button.
The page adjusts.
6. From the **Internet Service Provider** menu, select **PPTP** or **L2TP** as the encapsulation method.
The page adjusts.
7. In the **Login** field, enter the login name that your ISP gave you.
This login name is often an email address.
8. In the **Password** field, type the password that you use to log in to your Internet service.
9. From the **Connection Mode** menu, select **Always On**, **Dial on Demand**, or **Manually Connect**.
10. To change the number of minutes until the Internet login times out, in the **Idle Timeout (In minutes)** field, type the number of minutes.
This is how long the router keeps the Internet connection active when no one on the network is using the Internet connection. A value of 0 (zero) means never log out.
11. If your ISP gave you fixed IP addresses and a connection ID or name, type them in the **My IP Address**, **Subnet Mask**, **Server Address**, **Gateway IP Address**, and **Connection ID/Name** fields.
If your ISP did not give you IP addresses, a connection ID, or name, leave these fields blank. The connection ID or name applies to a PPTP service only.

12. Select a Domain Name Server (DNS) Address radio button:

- **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
- **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.

13. Select a Router MAC Address radio button:

- **Use Default Address.** Use the default MAC address.
- **Use Computer MAC Address.** The router captures and uses the MAC address of the computer that you are now using. You must use the one computer that the ISP allows.
- **Use This MAC Address.** Enter the MAC address that you want to use.

14. Click the **Apply** button.

Your settings are saved.

15. Click the **Test** button to test your Internet connection.

If the NETGEAR website does not display within one minute, see [You cannot access the Internet](#) on page 185.

Specify IPv6 Internet connections

You can set up an IPv6 Internet connection if the router does not detect it automatically.

To set up an IPv6 Internet connection:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**.
The IPv6 page displays.
5. From the **Internet Connection Type** menu, select the IPv6 connection type:
 - If you are not sure, select **Auto Detect** so that the router detects the IPv6 type that is in use.

- If your Internet connection does not use PPPoE or DHCP, or is not fixed, but is IPv6, select **Auto Config**.

If you are not sure about your type of IPv6 connection, you can also ask your Internet service provider (ISP).

6. Click the **Apply** button.
Your settings are saved.

Requirements for entering IPv6 addresses

IPv6 addresses are denoted by eight groups of hexadecimal quartets that are separated by colons. You can reduce any four-digit group of zeros within an IPv6 address to a single zero or omit it. The following errors invalidate an IPv6 address:

- More than eight groups of hexadecimal quartets
- More than four hexadecimal characters in a quartet
- More than two colons in a row

Use Auto Detect for an IPv6 Internet connection

To set up an IPv6 Internet connection through auto detection:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**.
The IPv6 page displays.
5. From the **Internet Connection Type** menu, select **Auto Detect**.
The page adjusts.
The router automatically detects the information in the following fields:
 - **Connection Type**. This field indicates the connection type that is detected.
 - **Router's IPv6 Address on WAN**. This field shows the IPv6 address that is acquired for the router's WAN (or Internet) interface. The number after the slash (/) is the

length of the prefix, which is also indicated by the underline () under the IPv6 address. If no address is acquired, the field displays Not Available.

- **Router's IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router's LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline () under the IPv6 address. If no address is acquired, the field displays Not Available.

6. Select an IP Address Assignment radio button:

- **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
- **Auto Config.** This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

7. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router's LAN interface.

If you do not specify an ID here, the router generates one automatically from its MAC address.

8. Click the **Apply** button.

Your settings are saved.

Set up an IPv6 6to4 tunnel Internet connection

The remote relay router is the router to which your router creates a 6to4 tunnel. Make sure that the IPv4 Internet connection is working before you apply the 6to4 tunnel settings for the IPv6 connection.

To set up an IPv6 Internet connection by using a 6to4 tunnel:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**.

The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **6to4 Tunnel**.

The page adjusts.

The router automatically detects the information in the Router's IPv6 Address on LAN field. This field shows the IPv6 address that is acquired for the router's LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. Select a Remote 6to4 Relay Router radio button:

- **Auto**. Your router uses any remote relay router that is available on the Internet. This is the default setting.
- **Static IP Address**. Enter the static IPv4 address of the remote relay router. Your IPv6 ISP usually provides this address.

7. Select an IPv6 Domain Name Server (DNS) Address radio button:

- **Get Automatically from ISP**. Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
- **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.

8. Select an IP Address Assignment radio button:

- **Use DHCP Server**. This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
- **Auto Config**. This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

9. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router's LAN interface.

If you do not specify an ID here, the router generates one automatically from its MAC address.

10. Click the **Apply** button.

Your settings are saved.

Set up an IPv6 pass-through Internet connection

In pass-through mode, the router works as a Layer 2 Ethernet switch with two ports (LAN and WAN Ethernet ports) for IPv6 packets. The router does not process any IPv6 header packets.

To set up a pass-through IPv6 Internet connection:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**.
The IPv6 page displays.
5. From the **Internet Connection Type** menu, select **Pass Through**.
The page adjusts, but no additional fields display.
6. Click the **Apply** button.
Your settings are saved.

Set up a fixed IPv6 Internet connection

To set up a fixed IPv6 Internet connection:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**.
The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **Fixed**.
The page adjusts.
6. Configure the fixed IPv6 addresses for the WAN connection:
 - **IPv6 Address/Prefix Length.** The IPv6 address and prefix length of the router WAN interface.
 - **Default IPv6 Gateway.** The IPv6 address of the default IPv6 gateway for the router's WAN interface.
 - **Primary DNS Server.** The primary DNS server that resolves IPv6 domain name records for the router.
 - **Secondary DNS Server.** The secondary DNS server that resolves IPv6 domain name records for the router.

Note: If you do not specify the DNS servers, the router uses the DNS servers that are configured for the IPv4 Internet connection on the Internet Setup page. (See [Manually set up the Internet connection](#) on page 24.)

7. Select an IP Address Assignment radio button:
 - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
 - **Auto Config.** This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

8. In the **IPv6 Address/Prefix Length** fields, specify the static IPv6 address and prefix length of the router's LAN interface.
If you do not specify an ID here, the router generates one automatically from its MAC address.
9. Click the **Apply** button.
Your settings are saved.

Set up an IPv6 DHCP Internet connection

To set up an IPv6 Internet connection with a DHCP server:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**.
The IPv6 page displays.
5. From the **Internet Connection Type** menu, select **DHCP**.
The page adjusts.
The router automatically detects the information in the following fields:
 - **Router's IPv6 Address on WAN**. This field shows the IPv6 address that is acquired for the router's WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline () under the IPv6 address. If no address is acquired, the field displays Not Available.
 - **Router's IPv6 Address on LAN**. This field shows the IPv6 address that is acquired for the router's LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline () under the IPv6 address. If no address is acquired, the field displays Not Available.
6. (Optional) In the **DHCP User Class (If Required)** field, enter a host name.
Most people can leave this field blank, but if your ISP gave you a specific host name, enter it here.
7. (Optional) In the **DHCP Domain Name (If Required)** field, enter a domain name.
You can type the domain name of your IPv6 ISP. Do not enter the domain name for the IPv4 ISP here. For example, if your ISP's mail server is mail.xxx.yyy.zzz, type xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.
8. Select an IPv6 Domain Name Server (DNS) Address radio button:
 - **Get Automatically from ISP**. Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
 - **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.
9. Select an IP Address Assignment radio button:

- **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
- **Auto Config.** This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

10. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router's LAN interface.

If you do not specify an ID here, the router generates one automatically from its MAC address.

11. Click the **Apply** button.
Your settings are saved.

Set up an IPv6 PPPoE Internet connection

To set up a PPPoE IPv6 Internet connection:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**.

The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **PPPoE**.

The page adjusts.

The router automatically detects the information in the following fields:

- **Router's IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router's WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (__) under the IPv6 address. If no address is acquired, the field displays Not Available.
- **Router's IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router's LAN interface. The number after the slash (/) is the length of the

prefix, which is also indicated by the underline () under the IPv6 address. If no address is acquired, the field displays Not Available.

6. In the **Login** field, enter the login information for the ISP connection.
This is usually the name that you use in your email address. For example, if your main mail account is JerAB@ISP.com, you would type JerAB in this field. Some ISPs (like Mindspring, Earthlink, and T-DSL) require that you use your full email address when you log in. If your ISP requires your full email address, type it in this field.
7. In the **Password** field, enter the password for the ISP connection.
8. In the **Service Name** field, enter a service name.
If your ISP did not provide a service name, leave this field blank.

Note: The default setting of the **Connection Mode** menu is Always On to provide a steady IPv6 connection. The router never terminates the connection. If the connection is terminated, for example, when the modem is turned off, the router attempts to reestablish the connection immediately after the PPPoE connection becomes available again.

9. Select an IPv6 Domain Name Server (DNS) Address radio button:
 - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
 - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.
10. Select an IP Address Assignment radio button:
 - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
 - **Auto Config.** This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).
11. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router's LAN interface.
If you do not specify an ID here, the router generates one automatically from its MAC address.
12. Click the **Apply** button.
Your settings are saved.

Use Auto Config for an IPv6 Internet connection

To set up an IPv6 Internet connection through autoconfiguration:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**.

The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **Auto Config**.

The page adjusts.

The router automatically detects the information in the following fields:

- **Router's IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router's WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline () under the IPv6 address. If no address is acquired, the field displays Not Available.
- **Router's IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router's LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline () under the IPv6 address. If no address is acquired, the field displays Not Available.

6. (Optional) In the **DHCP User Class (If Required)** field, enter a host name.

Most people can leave this field blank, but if your ISP gave you a specific host name, enter it here.

7. (Optional) In the **DHCP Domain Name (If Required)** field, enter a domain name.

You can type the domain name of your IPv6 ISP. Do not enter the domain name for the IPv4 ISP here. For example, if your ISP's mail server is mail.xxx.yyy.zzz, type xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.

8. Select an IPv6 Domain Name Server (DNS) Address radio button:
 - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
 - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.
9. Select an IP Address Assignment radio button:
 - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
 - **Auto Config.** This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).
10. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router's LAN interface.

If you do not specify an ID here, the router generates one automatically from its MAC address.
11. Click the **Apply** button.

Your settings are saved.

Set up an IPv6 6rd tunnel connection

The 6rd protocol makes it possible to deploy IPv6 to sites using a service provider's IPv4 network. 6rd uses the service provider's own IPv6 address prefix. This limits the operational domain of 6rd to the service provider's network and is under direct control of the service provider. The IPv6 service that is provided is equivalent to native IPv6.

The 6rd mechanism relies on an algorithmic mapping between the IPv6 and IPv4 addresses that are assigned for use within the service provider's network. This mapping allows for automatic determination of IPv4 tunnel endpoints from IPv6 prefixes, enabling stateless operation of 6rd.

To set up an IPv6 6rd tunnel connection:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

A login window opens.
3. Enter the router user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**.

The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **6rd Tunnel**.

The page adjusts.

The router automatically detects the information in the Router's IPv6 Address on LAN field. This field shows the IPv6 address that is acquired for the router's LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. In the 6rd Configuration section, configure the 6rd settings:

- **6rd Prefix.** Enter the IPv6 prefix that your ISP gave you.
- **6rd Prefix Length.** Enter the IPv6 prefix length that your ISP gave you.
- **6rd Border Relay Address.** Enter the border router's IPv4 address that your ISP gave you.
- **6rd Address Mask Length.** Enter the IPv4 mask length that your ISP gave you.

7. Select an IPv6 Domain Name Server (DNS) Address radio button:

- **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
- **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP's primary DNS server. If a secondary DNS server address is available, enter it also.

8. Select an IP Address Assignment radio button:

- **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
- **Auto Config.** This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

9. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router's LAN interface.

If you do not specify an ID here, the router generates one automatically from its MAC address.

10. Click the **Apply** button.
Your settings are saved.

Change the MTU size

To change the MTU size:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.
The WAN Setup page displays.
5. In the **MTU Size** field, enter a value from 616 to 1500.
6. Click the **Apply** button.
Your settings are saved.

4

Control Access to the Internet

The router comes with a built-in firewall that helps protect your home network from unwanted intrusions from the Internet.

This chapter contains the following sections:

- [Activate Armor using the Nighthawk app](#)
- [Enable Circle Smart Parental Controls using the Nighthawk app](#)
- [Network access control list](#)
- [Use keywords to block Internet sites](#)
- [Delete keywords from the blocked list](#)
- [Block services from the Internet](#)
- [Prevent blocking on a trusted computer](#)
- [Schedule when to block Internet sites and services](#)
- [Set up security event email notifications](#)

Activate Armor using the Nighthawk app

To activate Armor using the Nighthawk app:

1. Launch the Nighthawk app.
The dashboard displays.
2. Tap **Security**.
The Armor page displays.
3. Tap the **ACTIVATE** button.
Armor is activated.

Enable Circle Smart Parental Controls using the Nighthawk app

Before enabling Circle, make sure that your router is in router mode (which is the default mode). Your router must be in router mode to work with Circle. You can't enable Circle if your router is in access point (AP) mode or bridge mode.

To enable Circle Smart Parental Controls using the Nighthawk app:

1. Launch the Nighthawk app.
The dashboard displays.
2. Tap **Parental Controls**.
The Parental Control page displays.
3. Move the **Enable Circle** slider to the right to enable Circle.
4. Tap the **Download and Install Circle App** button.
5. Download the Circle app.
You must use the Circle app to finish setting up your Circle account.
6. Launch the Circle app and follow the prompts.

Network access control list

You can use the network access control list (ACL) on the router to block or allow access to your network and the Internet. The ACL identifies a WiFi or wired device by its MAC

address. The router detects the MAC addresses of the devices on the network and either allows or denies access.

The router detects and stores the MAC addresses of devices that connect to the network, so it lists the MAC addresses both of devices that are currently connected and any that were previously connected.

If you set up a network ACL that *allows* all new devices to connect, the following applies:

- You can either select or manually enter devices that you want to *block* from connecting to the network.
- All other devices are allowed access to the network.

If you set up a network ACL that *blocks* all new devices from connecting, the following applies:

- You can either select or manually enter devices that you want to *allow* access to the network.
- Devices that are currently connected to the network or that were allowed to connect in the past are automatically placed on the network ACL as allowed devices.
- All other devices are denied access to the network.

Note: Each network device has a MAC address that serves as a unique identifier. The MAC address is a 12-character physical address, containing the hexadecimal characters 0-9, a-f, or A-F (uppercase or lowercase) only, and separated by colons (for example, 00:09:AB:CD:EF:01). Typically, the MAC address is on the label of a device. If you cannot see the label, you can display the MAC address using the network configuration utilities on your computer or mobile device.

Enable the network access control list, set the access rule, and allow or block connected devices

When you enable network access control, you must select whether new devices are automatically allowed to access the network or are blocked from accessing the network. By default, devices that are already connected to the network are added to the ACL as allowed, but you can choose to block one or more of these devices from accessing the network.

To enable and manage the network access control list for the entire network and allow or block connected devices:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
 4. Select **ADVANCED > Security > Access Control**.
The Access Control page displays.
 5. Select the **Turn on Access Control** check box.
You must select this check box before you can select an access rule and use the Allow and Block buttons. When the Turn on Access Control check box is cleared, all devices are allowed to connect, even if a device is on the list of blocked devices.
 6. Click the **Apply** button.
Your settings are saved. Network access control is enabled.
 7. Select an access rule to apply to new devices:
 - **Allow all new devices to connect:** With this setting, if you connect a new device to the network, it can access the network. You do not need to enter its MAC address on this page. This option works for most home networks. You can also block one or more devices from accessing the network. For more information, see the following step.
 - **Block all new devices from connecting:** With this setting, if you want to allow a new device to connect, you must enter its MAC address on this page. (In this situation, a new device is a device that was not previously connected to the network.) For more information about allowing one or more devices, see the following step.
If you block all *new* devices from connecting, the device that you are currently using to connect to the router web interface, any other devices that are currently connected to the network, and all devices that were allowed to connect to the network in the past *are* still allowed access. That means that these devices are automatically added to the network ACL as allowed devices. If you want to block any of these devices, see the following step.
- Note:** Selecting an access rule does not affect previously blocked or allowed devices. It applies only to *new* devices trying to access the network after you apply this setting.
8. To change access for devices that are connected or were connected to the network, do the following:
 - **Currently connected devices:**

In the table that contains the ACL, the Status column shows either Allowed or Blocked for a device. To change the status, select the check box for the device, and click either the **Allow** button or the **Block** button.

Note: If you blocked all new devices from connecting, make sure that the computer or mobile device that you are currently using to access the router web interface shows as Allowed in the Status column.

- **Devices that were connected in the past:**

- To manage allowed devices that are currently not connected to the network, see [Manage allowed devices currently not on the network](#) on page 46.
- To manage blocked devices that are currently not connected to the network, see [Manage blocked devices currently not on the network](#) on page 48.

9. Click the **Apply** button.
Your settings are saved.

Manage allowed devices currently not on the network

If you set up an access control list (ACL) that blocks all new devices from accessing the network, you can add new devices that must be allowed access to the network, remove old devices, or change whether devices that were allowed must now be blocked when they try to connect to the network.

For example, you could add a second computer or mobile device for access to the router web management interface in case the device that you are currently using needs to be removed from the network for repairs.

To manage allowed devices currently not on the network:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Security > Access Control**.
The Access Control page displays.

5. Click the **View list of allowed devices not currently connected to the network** link.

A table displays the detected device name, MAC address, and connection type of the devices that are not connected but allowed to access the network.

In the following steps, we refer to the list of allowed devices not currently connected to the network as *the list of allowed devices*.

6. To add a device to the list of allowed devices, do the following:

- a. Click the **Add** button.

The Add Allowed Device page displays.

- b. Enter the MAC address and device name for the device that you want to allow.

- c. On the Add Allowed Device page, click the **Apply** button.

The device is added to the list of allowed devices.

7. To remove a device from the list of allowed devices, do the following:

- a. Select the check box for the device.

- b. Click the **Remove from the list** button.

The device is removed from the list of allowed devices.

8. To change the device status by blocking access for a device on the list of allowed devices, do the following:

- a. Select the check box for the device.

- b. Click the **Edit** button.

The Edit Device Name page displays.

- c. From the **Access Control** menu, selected **Block**.

- d. On the Edit Device Name page, click the **Apply** button.

The device is moved to the list of blocked devices not currently connected to the network.

9. To change the device name for a device on the list of allowed devices, do the following:

- a. Select the check box for the device.

- b. Click the **Edit** button.

The Edit Device Name page displays.

- c. In the **Device Name** field, enter a name.

- d. On the Edit Device Name page, click the **Apply** button.
The device name is changed on the list of allowed devices.

10. Click the **Apply** button.
Your settings are saved.

Manage blocked devices currently not on the network

If you set up an access control list (ACL) that allows all new devices to access the network, you can add new devices that must be blocked from accessing the network, remove old devices, or change whether devices that were blocked must now be allowed when they try to connect to the network.

To manage blocked devices currently not on the network:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
 2. Enter **http://www.routerlogin.net**.
A login window opens.
 3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
 4. Select **ADVANCED > Security > Access Control**.
The Access Control page displays.
 5. Click the **View list of blocked devices not currently connected to the network** link.
The Access Control page displays.
A table displays the detected device name, MAC address, and connection type of the devices that are not connected and are blocked from accessing the network.
In the following steps, we refer to the list of blocked devices not currently connected to the network as *the list of blocked devices*.
 6. To add a device to the list of blocked devices, do the following:
 - a. Click the **Add** button.
The Add Blocked Device page displays.
 - b. Enter the MAC address and device name for the device that you want to block.
 - c. On the Add Blocked Device page, click the **Apply** button.
-

The device is added to the list of blocked devices.

7. To remove a device from the list of blocked devices, do the following:
 - a. Select the check box for the device.
 - b. Click the **Remove from the list** button.

The device is removed from the list of blocked devices.

8. To change the device status by allowing access for a device on the list of blocked devices, do the following:
 - a. Select the check box for the device.
 - b. Click the **Edit** button.

The Edit Device Name page displays.
 - c. From the **Access Control** menu, selected **Allow**.
 - d. On the Edit Device Name page, click the **Apply** button.

The device is moved to the list of allowed devices not currently connected to the network.

9. To change the device name for a device on the list of blocked devices, do the following:
 - a. Select the check box for the device.
 - b. Click the **Edit** button.

The Edit Device Name page displays.
 - c. In the **Device Name** field, enter a name.
 - d. On the Edit Device Name page, click the **Apply** button.

The device name is changed on the list of blocked devices.

10. Click the **Apply** button.

Your settings are saved.

Use keywords to block Internet sites

You can use keywords to block certain Internet sites from your network. You can use blocking all the time or based on a schedule.

To block Internet sites:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Security > Block Sites**.
The Block Sites page displays.
5. Select a keyword blocking option:
 - **Per Schedule**. Turn on keyword blocking according to a schedule that you set. For more information, see [Schedule when to block Internet sites and services](#) on page 53.
 - **Always**. Turn on keyword blocking all the time, independent of the Schedule page.
6. In the **Type keyword or domain name here** field, enter a keyword or domain that you want to block.
For example:
 - Specify XXX to block <http://www.badstuff.com/xxx.html>.
 - Specify .com if you want to allow only sites with domain suffixes such as .edu or .gov.
 - Enter a period (.) to block all Internet browsing access.
7. Click the **Add Keyword** button.
The keyword is added to the keyword list. The keyword list supports up to 32 entries.
8. Click the **Apply** button.
Keyword blocking takes effect.

Delete keywords from the blocked list

To delete keywords from the list:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Security > Block Sites**.
The Block Sites page displays.
5. Do one of the following:
 - To delete a single word, select it and click the **Delete Keyword** button.
The keyword is removed from the list.
 - To delete all keywords on the list, click the **Clear List** button.
All keywords are removed from the list.
6. Click the **Apply** button.
Your settings are saved.

Block services from the Internet

You can block Internet services on your network based on the type of service. You can block the services all the time or based on a schedule.

To block services:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
 2. Enter **http://www.routerlogin.net**.
A login window opens.
 3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
-

The BASIC Home page displays.

4. Select **ADVANCED > Security > Block Services**.

The Block Services page displays.

5. Specify when to block the services:

- To block the services all the time, select the **Always** radio button.
- To block the services based on a schedule, select the **Per Schedule** radio button.

For information about how to specify the schedule, see [Schedule when to block Internet sites and services](#) on page 53.

6. Click the **Add** button.

The Block Services Setup page displays.

7. To add a service that is in the **Service Type** menu, select the application or service. The settings for this service automatically display in the fields.

8. To add a service or application that is not in the menu, select **User Defined**, and do the following:

- a. If you know that the application uses either TCP or UDP, select the appropriate protocol. Otherwise, select **TCP/UDP** (both).

- b. Enter the starting port and ending port numbers.

If the service uses a single port number, enter that number in both fields. To find out which port numbers the service or application uses, you can contact the publisher of the application, ask user groups or newsgroups, or search on the Internet.

- c. In the **Service Type/User Defined** field, enter a name for the service.

9. Select a filtering option:

- **Only This IP Address**. Block services for a single computer.
- **IP Address Range**. Block services for a range of computers with consecutive IP addresses on your network.
- **All IP Addresses**. Block services for all computers on your network.

10. Click the **Add** button.

Your settings are saved.

Prevent blocking on a trusted computer

You can exempt one trusted computer from blocking. The computer that you exempt must be assigned a fixed IP address. You can use the reserved IP address feature to specify the IP address. See [Manage reserved LAN IP addresses](#) on page 63.

To specify a trusted computer:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Security > Block Sites**.
The Block Sites page displays.
5. Scroll down and select the **Allow trusted IP address to visit blocked sites** check box.
6. In the **Trusted IP Address** field, enter the IP address of the trusted computer.
7. Click the **Apply** button.
Your settings are saved.

Schedule when to block Internet sites and services

When you schedule blocking, the same schedule is used to block sites and to block services. For information about how to specify what you want the router to block, see [Use keywords to block Internet sites](#) on page 49 and [Block services from the Internet](#) on page 51.

To schedule blocking:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Security > Schedule**.
The Schedule page displays.
5. Specify when to block keywords and services:
 - **Days to Block**. Select the check box for each day that you want to block the keywords, or select the **Every Day** check box, which automatically selects the check boxes for all days.
 - **Time of Day to Block**. Select a start and end time in 24-hour format, or select the **All Day** check box for 24-hour blocking.
6. Click the **Apply** button.
Your settings are saved.

Set up security event email notifications

The router can email you its logs of router activity. The log records router activity and security events such as attempts to access blocked sites or services.

To set up email notifications:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Security > E-mail**.
The E-mail page displays.
5. Select the **Turn E-mail Notification On** check box.

6. In the **Send to This E-mail Address** field, type the email address to which logs and alerts are to be sent.

This email address is also used for the From address. If this field is blank, log and alert messages are not sent.

7. In the **Sender** field, enter the email sender's name.
8. In the **Your Outgoing Mail Server** field, enter the name of your ISP outgoing (SMTP) mail server (such as mail.myISP.com).

You might be able to find this information in the configuration window of your email program. If you leave this field blank, log and alert messages are not sent.

9. In the **Outgoing Mail Server Port Number** field, enter a port number in the field. If you do not know the port number, leave the default port number.
10. If your outgoing email server requires authentication, select the **My Mail Server requires authentication** check box, and do the following:
 - a. In the **User Name** field, type the user name for the outgoing email server.
 - b. In the **Password** field, type the password for the outgoing email server.

11. To send alerts when someone attempts to visit a blocked site, select the **Send Alerts Immediately** check box.

Email alerts are sent immediately when someone attempts to visit a blocked site.

12. To send logs based on a schedule, specify these settings:
 - a. From **Send logs according to this schedule** menu, select the schedule type.
 - b. From the **Day** menu, select the day.
 - c. From the **Time** menu, select the time, and select the **am** or **pm** radio button.

13. Click the **Apply** button.

Your settings are saved.

Logs are sent automatically according to the schedule that you set. If the log fills before the specified time, it is sent. After the log is sent, it is cleared from the router memory. If the router cannot email the log and the log buffer fills, the router overwrites the log.

5

Network Settings

The router comes ready for WiFi, Ethernet, and USB connections. You can customize the router's network settings. We recommend that you install the router and connect it to the Internet before you change its network settings.

This chapter includes the following sections:

- [View or change the WAN settings](#)
- [Set up a default DMZ server](#)
- [Change the router's device name](#)
- [Change the LAN TCP/IP settings](#)
- [Specify the IP addresses that the router assigns](#)
- [Disable the DHCP server feature in the router](#)
- [Manage reserved LAN IP addresses](#)
- [Use the WPS Wizard for WiFi connections](#)
- [Specify basic WiFi settings](#)
- [Change the WiFi Mbps Settings](#)
- [Change the WiFi password or the WiFi security](#)
- [Configure WPA/WPA2 Enterprise WiFi security](#)
- [Set up a guest WiFi network](#)
- [Control the WiFi radios](#)
- [Set up a WiFi schedule](#)
- [Specify WPS settings](#)
- [Set up the router as a WiFi access point](#)
- [Set Up a Bridge for a Port Group or VLAN Tag Group](#)
- [Manage custom static routes](#)
- [Improve network connections with Universal Plug and Play](#)
- [Manage advanced WiFi settings](#)

View or change the WAN settings

You can view or configure wide area network (WAN) settings for the Internet port. You can set up a DMZ (demilitarized zone) server, change the maximum transmit unit (MTU) size, and enable the router to respond to a ping to its WAN (Internet) port.

To view or change the WAN settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.
The WAN Setup page displays.

View or change the following settings:

- **Disable Port Scan and DoS Protection.** DoS protection protects your LAN against denial of service attacks such as Syn flood, Smurf Attack, Ping of Death, and many others. Select this check box only in special circumstances.
- **Default DMZ Server.** This feature is sometimes helpful when you are playing online games or videoconferencing, but it makes the firewall security less effective.
- **Respond to Ping on Internet Port.** This feature allows your router to be discovered. Use this feature only as a diagnostic tool or for a specific reason.
- **Disable IGMP Proxying.** IGMP proxying allows a computer on the local area network (LAN) to receive the multicast traffic it is interested in from the Internet. If you do not need this feature, you can select this check box to disable it.
- **MTU Size (in bytes).** The normal MTU (maximum transmit unit) value for most Ethernet networks is 1500 bytes, or 1492 bytes for PPPoE connections. Change the MTU only if you are sure that it is necessary for your ISP connection.
- **NAT Filtering.** Network Address Translation (NAT) determines how the router processes inbound traffic. Secured NAT protects computers on the LAN from attacks from the Internet but might prevent some Internet games, point-to-point applications, or multimedia applications from working. Open NAT provides a much less secured firewall but allows almost all Internet applications to work.

- **Disable SIP ALG.** Some voice and video communication applications do not work well with the SIP ALG. Disabling the SIP ALG might help your voice and video applications to create and accept a call through the router.

5. Click the **Apply** button.

Your settings are saved.

Set up a default DMZ server

The default DMZ server feature is helpful when you are using some online games and videoconferencing applications that are incompatible with Network Address Translation (NAT). The router is programmed to recognize some of these applications and to work correctly with them, but other applications might not function well. In some cases, one local computer can run the application correctly if the IP address for that computer is entered as the default DMZ server.

WARNING: DMZ servers pose a security risk. A computer designated as the default DMZ server loses much of the protection of the firewall and is exposed to exploits from the Internet. If compromised, the DMZ server computer can be used to attack other computers on your network.

The router usually detects and discards incoming traffic from the Internet that is not a response to one of your local computers or a service that you configured on the Port Forwarding/Port Triggering page. Instead of discarding this traffic, you can specify that the router forwards the traffic to one computer on your network. This computer is called the default DMZ server.

To set up a default DMZ server:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.
The WAN Setup page displays.

5. Select the **Default DMZ Server** check box.
6. Type the IP address.
7. Click the **Apply** button.
Your settings are saved.

Change the router's device name

The router's default device name is based on its model number. This device name displays in the file manager when you browse your network.

To change the router's device name:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
The LAN Setup page displays.
5. In the **Device Name** field, type a new name.
6. Click the **Apply** button.
Your settings are saved.

Change the LAN TCP/IP settings

The router is preconfigured to use private IP addresses on the LAN side and to act as a DHCP server. The router's default LAN IP configuration is as follows:

- **LAN IP address.** 192.168.1.1
- **Subnet mask.** 255.255.255.0

These addresses are part of the designated private address range for use in private networks and are suitable for most applications. If your network requires a different IP addressing scheme, you can change these settings.

You might want to change these settings if you need a specific IP subnet that one or more devices on the network use, or if you use competing subnets with the same IP scheme.

To change the LAN TCP/IP settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
The LAN Setup page displays.
5. In the **IP Address** field, type the IP address.
6. In the **IP Subnet Mask** field, type the subnet mask of the router.
The IP address and subnet mask identify which addresses are local to a specific device and which must be reached through a gateway or router.
7. Change the RIP settings.
Router Information Protocol (RIP) allows a router to exchange routing information with other routers.
 - a. Select the RIP direction:
 - **Both**. The router broadcasts its routing table periodically and incorporates information that it receives.
 - **Out Only**. The router broadcasts its routing table periodically.
 - **In Only**. The router incorporates the RIP information that it receives.
 - b. Select the RIP version:
 - **Disabled**. This is the default setting.
 - **RIP-1**. This format is universally supported. It is adequate for most networks, unless you are using an unusual network setup.

- **RIP-2.** This format carries more information. Both RIP-2B and RIP-2M send the routing data in RIP-2 format. RIP-2B uses subnet broadcasting. RIP-2M uses multicasting.

8. Click the **Apply** button.

Your settings are saved.

If you changed the LAN IP address of the router, you are disconnected when this change takes effect.

9. To reconnect, close your browser, relaunch it, and log in to the router.

Specify the IP addresses that the router assigns

By default, the router acts as a Dynamic Host Configuration Protocol (DHCP) server. The router assigns IP, DNS server, and default gateway addresses to all computers connected to the LAN. The assigned default gateway address is the LAN address of the router.

These addresses must be part of the same IP address subnet as the router's LAN IP address. Using the default addressing scheme, define a range between 192.168.1.2 and 192.168.1.254, although you can save part of the range for devices with fixed addresses.

To specify the pool of IP addresses that the router assigns:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
The LAN Setup page displays.
5. Make sure that the **Use Router as DHCP Server** check box is selected.

6. Specify the range of IP addresses that the router assigns:
 - a. In the **Starting IP Address** field, type the lowest number in the range.
This IP address must be in the same subnet as the router.
 - b. In the **Ending IP Address** field, type the number at the end of the range of IP addresses.
This IP address must be in the same subnet as the router.
7. Click the **Apply** button.
Your settings are saved.

The router delivers the following address information to any LAN device that requests a DHCP address:

- An IP address from the range that you define
- Subnet mask
- Gateway IP address (the router's LAN IP address)
- DNS server IP address (the router's LAN IP address)

Disable the DHCP server feature in the router

By default, the router acts as a DHCP server. The router assigns IP, DNS server, and default gateway addresses to all computers connected to the LAN. The assigned default gateway address is the LAN address of the router.

You can use another device on your network as the DHCP server or specify the network settings of all your computers.

To disable the DHCP server feature in the router:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.

The LAN Setup page displays.

5. Clear the **Use Router as DHCP Server** check box.
6. Click the **Apply** button.
Your settings are saved.
7. (Optional) If this service is disabled and no other DHCP server is on your network, set your computer IP addresses manually so that the computers can access the router.

Manage reserved LAN IP addresses

When you specify a reserved IP address for a computer on the LAN, that computer always receives the same IP address each time it accesses the router's DHCP server. Assign reserved IP addresses to computers or servers that require permanent IP settings.

Reserve an IP address

To reserve an IP address:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
The LAN Setup page displays.
5. In the Address Reservation section, click the **Add** button.
The Address Reservation page displays.
6. In the **IP Address** field, type the IP address to assign to the computer or server.
Choose an IP address from the router's LAN subnet, such as 192.168.1.x.
7. Type the MAC address of the computer or server.

Tip: If the computer is already on your network, you can copy its MAC address from the Attached Devices page and paste it here.

8. Click the **Apply** button.

The reserved address is entered into the table.

The reserved address is not assigned until the next time the computer contacts the router's DHCP server. Reboot the computer, or access its IP configuration and force a DHCP release and renew.

Edit a reserved IP address

To edit a reserved address entry:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
The LAN Setup page displays.
5. Select the radio button next to the reserved address that you want to edit.
6. Click the **Edit** button.
The Address Reservation page displays.
7. Change the settings.
8. Click the **Apply** button.
Your settings are saved.

Delete a reserved IP address entry

To delete a reserved address entry:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Setup > LAN Setup**.

The LAN Setup page displays.

5. Select the radio button next to the reserved address that you want to delete.
6. Click the **Delete** button.

The address is removed.

Use the WPS Wizard for WiFi connections

The WPS Wizard helps you connect WPS-enabled devices to your WiFi network without typing the WiFi password.

You can use the WPS Wizard or you can use the physical **WPS** button on your router to connect WPS-enabled devices. To use the physical **WPS** button on your router, see [Connect to the WiFi network using WPS](#) on page 17 for more information.

To use the WPS Wizard to connect to the WiFi network:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > WPS Wizard**.

The Add WPS Client page displays.

5. Click the **Next** button.

The page displays instructions about how to connect using WPS.

6. Click the **WPS** button that displays on the page.

Note: To use the physical **WPS** push button on the router, see [Connect to the WiFi network using WPS](#) on page 17 and follow the instructions in that section.

7. Within two minutes, on your WPS-enabled device, press its **WPS** button or follow its instructions for how to connect using WPS.

A success page displays if your WPS-enabled device successfully connects to the WiFi network.

Specify basic WiFi settings

The router comes with preset security. This means that the WiFi network name (SSID), network key (password), and security option (encryption protocol) are preset in the factory. You can find the preset SSID and password on the router label.

Note: The preset SSID and password are uniquely generated for every device to protect and maximize your WiFi security.

If you change your preset security settings, make a note of the new settings and store it in a safe place where you can easily find it.

If your computer is connected with WiFi when you change the SSID or other WiFi security settings, you are disconnected when you click the **Apply** button. To avoid this problem, use a computer with a wired connection to access the router.

To specify basic WiFi settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Wireless**.
The Wireless Settings page displays.
You can specify the settings for the 2.4 GHz band and 5 GHz band.
5. From the **Region** menu, select your region.
In some locations, you cannot change this setting.
6. To control the SSID broadcast, select or clear the **Enable SSID Broadcast** check box.

When this check box is selected, the router broadcasts its network name (SSID) so that it displays when you scan for local WiFi networks on your computer or mobile device.

7. To change the network name (SSID), type a new name in the **Name (SSID)** field.
The name can be up to 32 characters long and it is case-sensitive. The default SSID is randomly generated and is on the router label. If you change the name, make sure to write down the new name and keep it in a safe place.
8. To change the WiFi channel, select a number from the **Channel** menu.
In some regions, not all channels are available. Do not change the channel unless you experience interference (shown by lost connections or slow data transfers). If this happens, experiment with different channels to see which is the best.

When you use multiple access points, it is better if adjacent access points use different channels to reduce interference. The recommended channel spacing between adjacent access points is four channels (for example, use Channels 1 and 5, or 6 and 10).
9. Click the **Apply** button.
Your settings are saved.

If you connected wirelessly to the network and you changed the SSID, you are disconnected from the network.
10. Make sure that you can connect wirelessly to the network with its new settings.
If you cannot connect wirelessly, check the following:
 - Is your computer or mobile device connected to another WiFi network in your area? Some WiFi devices automatically connect to the first open network without WiFi security that they discover.
 - Is your computer or mobile device trying to connect to your network with its old settings (before you changed the settings)? If so, update the WiFi network selection in your computer or mobile device to match the current settings for your network.

Change the WiFi Mbps Settings

The data rate for high-speed transmissions is commonly identified as megabits per second (Mbps).

By default, the router is set to operate with up to 450 Mbps in the 2.4 GHz WiFi band and up to 1,300 Mbps in the 5 GHz WiFi band. You can select slower settings.

To change the WiFi Mbps settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Wireless**.
The Wireless Settings page displays.
5. For the 2.4 GHz WiFi band, in the Wireless Network (2.4 GHz b/g/n) section, select a setting from the **Mode** menu.
Up to 450 Mbps is the default setting. The other settings are **Up to 217 Mbps** and **Up to 54 Mbps**.
6. For the 5 GHz WiFi band, select a setting from the **Mode** menu.
Up to 1300 Mbps is the default setting, which allows 802.11ac, 11n, and 11ad WiFi devices to join the network. The other settings are **Up to 600 Mbps** and **Up to 289 Mbps**.
7. Click the **Apply** button.
Your settings are saved.

Change the WiFi password or the WiFi security

The WiFi password is different from the admin password that you use to log in to the router.

Your router comes with preset WPA2 or WPA security. We recommend that you use the preset security, but you can change the settings. Do not disable the preset security.

To change the WiFi password or the WiFi security:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **Wireless**.

The Wireless Settings page displays.

5. To change the 2.4 GHz or 5 GHz WiFi password, enter a new password in the **Password (Network Key)** field.

You must enter a phrase of 8 to 63 characters. The **Password (Network Key)** field displays if the **WPA2-PSK [AES]** or **WPA-PSK [TKIP] + WPA2-PSK [AES]** security radio button is selected.

6. To change the WiFi security for the 2.4 GHz or 5 GHz WiFi network, select a **Security Options** radio button.

- **None**. An open WiFi network that does not provide any security. Any WiFi device can join the WiFi network. We recommend that you do not use an open WiFi network.
- **WPA2-PSK [AES]**. This option is the default setting. This type of security enables WiFi devices that support WPA2 to join the router's WiFi network. If you did not change the WiFi password, the default password displays. The default password is printed on the router label. WPA2 provides a secure connection but some older WiFi devices do not detect WPA2 and support only WPA. If your network includes such older devices, select WPA-PSK [TKIP] + WPA2-PSK [AES] security.
- **WPA-PSK [TKIP] + WPA2-PSK [AES]**. This type of security enables WiFi devices that support either WPA or WPA2 to join the router's WiFi network. However, WPA-PSK [TKIP] is less secure than WPA2-PSK [AES] and limits the speed of WiFi devices to 54 Mbps.
- **WPA/WPA2 Enterprise**. This type of security requires that your WiFi network can access a RADIUS server.

7. Click the **Apply** button.

Your settings are saved.

Configure WPA/WPA2 Enterprise WiFi security

Remote Authentication Dial In User Service (RADIUS) is an enterprise-level method for centralized Authentication, Authorization, and Accounting (AAA) management. To enable the router to provide WPA and WPA2 enterprise WiFi security, the WiFi network that the router provides must be able to access a RADIUS server.

Note: If you want to change the WiFi settings of the router's main network, use a wired connection to avoid being disconnected when the new WiFi settings take effect.

To configure WPA and WPA2 enterprise security:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Wireless**.
The Wireless Settings page displays.

Note: If you are configuring a guest network, select Guest Network instead. The Guest Network Settings page displays.

5. Enter the following WPA/WPA2 Enterprise settings:
 - **Encryption mode.** From the Encryption Mode menu, select the enterprise mode:
 - **WPA [TKIP] +WPA2 [AES].** This type of security enables WiFi devices that support either WPA or WPA2 to join the router's WiFi network. This is the default mode.
 - **WPA2 [AES].** WPA2 provides a secure connection but some older WiFi devices do not detect WPA2 and support only WPA. If your network includes such older devices, select WPA [TKIP] + WPA2 [AES] security.
 - **Group Key Update Interval.** Enter the interval in seconds after which the RADIUS group key is updated. The default interval is 3600 seconds.

- **RADIUS server IP Address.** Enter the IPv4 address of the RADIUS server to which the WiFi network can connect.
 - **RADIUS server Port.** Enter the number of the port on the router that is used to access the RADIUS server for authentication. The default port number is 1812.
 - **RADIUS server Shared Secret.** Enter the shared secret (RADIUS password) that is used between the router and the RADIUS server during authentication of a WiFi user.
6. Click the **Apply** button.
Your settings are saved.
7. Make sure that you can reconnect over WiFi to the network with its new security settings.
If you cannot connect over WiFi, check the following:
- If your computer or mobile device is already connected to another WiFi network in your area, disconnect it from that WiFi network and connect it to the WiFi network that the router provides.
Some WiFi devices automatically connect to the first open network without WiFi security that they discover.
 - If your computer or mobile device is trying to connect to your network with its old settings (before you changed the settings), update the WiFi network selection in your computer or mobile device to match the current settings for your network.
 - Does your computer or mobile device display as an attached device?
If it does, it is connected to the network.
 - Are you using the correct network name (SSID) and password?

Set up a guest WiFi network

A guest network allows visitors to use the Internet without using your WiFi security password or with a different WiFi password. By default, the guest WiFi network is disabled. You can enable and configure the guest WiFi network for each WiFi band. The router simultaneously supports the 2.4 GHz band for 802.11n, 802.11g, and 802.11b devices and the 5 GHz band for 802.11ac, 802.11n, and 802.11a devices.

The WiFi mode of the guest WiFi network depends on the WiFi mode of the main WiFi network. For example, if you configure the WiFi mode for the main WiFi network as Up to 54 Mbps in the 2.4 GHz band, the guest WiFi network also functions in the Up to 54 Mbps mode in the 2.4 GHz band. The channel also depends on the channel selection of the main WiFi network.

The router provides two default guest networks with the following names (SSIDs):

- **2.4 GHz guest WiFi network SSID.** NETGEAR-Guest
- **5 GHz guest WiFi network SSID.** NETGEAR-5G-Guest

By default, these networks are configured as open networks without security but are disabled. You can enable one or both networks. You can also change the SSIDs for these networks.

To set up a guest network:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Guest Network**.
The Guest Network Settings page displays.
5. Configure the following settings to set up a 2.4 GHz or 5 GHz guest WiFi network:
 - **Enable Guest Network.** By default, the guest WiFi network is disabled. To enable the guest WiFi network for the 2.4 GHz or 5 GHz WiFi band, select the **Enable Guest Network** check box.
 - **Enable SSID Broadcast.** By default, the router broadcasts the SSID of the WiFi band so that WiFi stations can detect the WiFi name (SSID) in their scanned network lists. To turn off the SSID broadcast for the 2.4 GHz or 5 GHz guest WiFi network, clear the **Enable SSID Broadcast** check box.
 - **Allow guests to see each other and access my local network.** By default, WiFi clients that are connected to the 2.4 GHz or 5 GHz guest WiFi network cannot access WiFi devices or Ethernet devices that are connected to the main WiFi network. To allow access to the main WiFi network, select the **Allow guests to see each other and access my local network** check box.
 - **Guest Wireless Network Name (SSID).** The SSID is the 2.4 GHz or 5 GHz guest WiFi network name. The default 2.4 GHz SSID is NETGEAR_Guest. The default 5 GHz SSID NETGEAR-5G_Guest.
To change the SSID, enter a 32-character (maximum), case-sensitive name in this field.

6. Select a WiFi security option for the 2.4 GHz or 5 GHz guest WiFi network:
 - **None.** An open WiFi network that does not provide any security. Any WiFi device can join the 2.4 GHz or 5 GHz guest WiFi network. This is the default setting for the guest WiFi network.
 - **WPA2-PSK [AES].** WPA2 provides a secure and fast connection but some older WiFi devices do not detect WPA2 and support only WPA. Select WPA2-PSK [AES] security to allow 802.11n devices to connect to the 2.4 GHz or 5 GHz guest WiFi network at the fastest speed. If your network includes older devices that do not support WPA2, select WPA-PSK [TKIP] + WPA2-PSK [AES] security. To use WPA2 security, in the **Password (Network Key)** field, enter a phrase of 8 to 63 characters. To join the 2.4 GHz or 5 GHz guest WiFi network, a user must enter this password.
 - **WPA-PSK [TKIP] + WPA2-PSK [AES].** This type of security enables WiFi devices that support either WPA or WPA2 to join the 2.4 GHz band of the guest WiFi network. However, WPA-PSK [TKIP] is less secure than WPA2-PSK [AES] and limits the speed of WiFi devices to 54 Mbps. To use WPA + WPA2 security, in the **Password (Network Key)** field, enter a phrase of 8 to 63 characters. To join the 2.4 GHz or 5 GHz guest WiFi network, a user must enter this password.
7. Click the **Apply** button.
Your settings are saved.
8. Make sure that you can reconnect over WiFi to the network with its new security settings.
If you cannot connect over WiFi, check the following:
 - If your computer or mobile device is already connected to another WiFi network in your area, disconnect it from that WiFi network and connect it to the WiFi network that the router provides.
Some WiFi devices automatically connect to the first open network without WiFi security that they discover.
 - Does your computer or mobile device display as an attached device?
If it does, it is connected to the network.
 - Are you using the correct network name (SSID) and password?

Control the WiFi radios

The router's internal WiFi radios broadcast signals in the 2.4 GHz and 5 GHz ranges. By default, they are on so that you can connect over WiFi to the router. When the WiFi radios are off, you can still use an Ethernet cable for a LAN connection to the router.

You can turn the WiFi radios on and off with the **WiFi On/Off** button on the router, or you can log in to the router and enable or disable the WiFi radios. If you are close to the router, it might be easier to press its **WiFi On/Off** button. If you are away from the router or already logged in, it might be easier to enable or disable them.

Use the WiFi On/Off button

To turn the WiFi radios off and on with the WiFi On/Off button:

Press the **WiFi On/Off** button on the top of the router for two seconds.

If you turned off the WiFi radios, the WiFi On/Off LED and the WPS LED turn off. If you turned on the WiFi radios, the WiFi On/Off LED and the WPS LED light.

Enable or disable the WiFi radios

If you used the **WiFi On/Off** button to turn off the WiFi radios, you can't log in to the router to turn them back on. You must press the **WiFi On/Off** button again for two seconds to turn the WiFi radios back on.

To enable or disable the WiFi radios:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays.
5. Do one of the following for your router's WiFi networks:
 - **Turn off the WiFi radio.** Clear the **Enable Wireless Router Radio** check box.
 - **Turn on the WiFi radio.** Select the **Enable Wireless Router Radio** check box.
6. Click the **Apply** button.
Your settings are saved.

Set up a WiFi schedule

You can turn off the WiFi signal from your router at times when you do not need a WiFi connection. For example, you might turn it off for the weekend if you leave town.

To set up the WiFi schedule:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays.
5. Click the **Add a new period** button.
The page adjusts.
6. Use the menus, radio buttons, and check boxes to set up a period during which you want to turn off the WiFi signal.
7. Click the **Apply** button.
The Wireless Settings page displays.
8. Select the **Turn off wireless signal by schedule** check box to activate the schedule.
9. Click the **Apply** button.
Your settings are saved.

Specify WPS settings

Wi-Fi Protected Setup (WPS) lets you join the WiFi network without typing the WiFi password.

To specify WPS settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays.
The Router's PIN field displays the fixed PIN that you can use to configure the router's WiFi settings from another device through WPS.
5. (Optional) Select or clear the **Enable Router's PIN** check box.
The PIN function might temporarily be disabled when the router detects suspicious attempts to break into the router's WiFi settings by using the router's PIN through WPS. You can manually enable the PIN function by selecting the **Enable Router's PIN** check box.
6. (Optional) Select or clear the **Keep Existing Wireless Settings** check box.
By default, the **Keep Existing Wireless Settings** check box is selected. We recommend that you leave this check box selected.
If you clear this check box, the next time a new WiFi client uses WPS to connect to the router, the router WiFi settings change to an automatically generated random SSID and security key.
7. Click the **Apply** button.
Your settings are saved.

Set up the router as a WiFi access point

You can set up the router to run as an access point (AP) on the same local network as another router.

To set up the router as an AP:

1. Use an Ethernet cable to connect the Internet port of this router to an Ethernet port on the other router.
 2. Launch a web browser from a computer or mobile device that is connected to the router network.
 3. Enter **http://www.routerlogin.net**.
A login window opens.
 4. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
 5. Select **ADVANCED > Advanced Setup > Wireless AP**.
The Wireless AP page displays.
 6. Select the **Enable AP Mode** check box.
The page adjusts.
 7. Select an IP address setting:
 - **Get dynamically from existing router**. The other router on the network assigns an IP address to this router while it is in AP mode.
 - **Use fixed IP settings on this device (not recommended)**. Use this setting if you want to manually assign a specific IP address to this router while it is in AP mode. Using this option effectively requires advanced network experience.
- Note:** To avoid interference with other routers or gateways in your network, we recommend that you use different WiFi settings on each router. You can also turn off the WiFi radio on the other router or gateway and use this router only for WiFi client access.
8. Click the **Apply** button.
The IP address of the router changes, and you are disconnected.
 9. To reconnect, close and restart your browser and type **http://www.routerlogin.net**.

Set Up a Bridge for a Port Group or VLAN Tag Group

Some devices, such as an IPTV, cannot function behind the router's Network Address Translation (NAT) service or firewall. Based on what your Internet service provider (ISP) requires, for the device to connect to the ISP's network directly, you can enable the bridge between the device and the router's Internet port or add new VLAN tag groups to the bridge.

Note: If your ISP provides directions on how to set up a bridge for IPTV and Internet service, follow those directions.

Set Up a Bridge for a Port Group

If the devices that are connected to the router's Ethernet LAN port or WiFi network include an IPTV device, your ISP might require you to set up a bridge for a port group for the router's Internet interface.

A bridge with a port group prevents packets that are sent between the IPTV device and the router's Internet port from being processed through the router's Network Address Translation (NAT) service.

To configure a port group and enable the bridge:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VLAN / IPTV Setup**.
The VLAN / IPTV Setup page displays.
5. Select the **Enable VLAN/IPTV Setup** check box.
The page expands.
6. Select the **By bridge group** radio button.
7. Select a Wired Ports check box or a Wireless check box.

- If your device is connected to an Ethernet port on the router, select the Wired Devices check box that corresponds to the Ethernet port on the router to which the device is connected.
- If your device is connected to your router's WiFi network, select the Wireless check box that corresponds to the router's WiFi network to which the device is connected.

Note: You must select at least one Wired Devices or Wireless check box. You can select more than one check box.

8. Click the **Apply** button.
Your settings are saved.

Set Up a Bridge for a VLAN Tag Group

If the devices that are connected to the router's Ethernet LAN ports or WiFi network include an IPTV device, your ISP might require you to set up a bridge for a VLAN tag group for the router's Internet interface.

If you are subscribed to IPTV service, the router might require VLAN tags to distinguish between the Internet traffic and the IPTV traffic. A bridge with a VLAN tag group prevents packets that are sent between the IPTV device and the router's Internet port from being processed through the router's Network Address Translation (NAT) service.

You can add VLAN tag groups to a bridge and assign VLAN IDs and priority values to each VLAN tag group.

To add a VLAN tag group and enable the bridge:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VLAN / IPTV Setup**.
The VLAN / IPTV Setup page displays.
5. Select the **Enable VLAN/IPTV Setup** check box.
6. Select the **By VLAN tag group** radio button.
The router includes a default VLAN tag group with the name Internet.

7. Click the **Add** button.
8. Specify the settings as described in the following table.

Field	Description
Name	Enter a name for the VLAN tag group. The name can be up to 10 characters.
VLAN ID	Enter a value from 1 to 4094.
Priority	Enter a value from 0 to 7.
Wired Ports	If your device is connected to an Ethernet port on the router, select the Wired Ports check box that corresponds to the Ethernet port on the router that the device is connected to.
Wireless	If your device is connected to your router's WiFi network, select the Wireless check box that corresponds to the router's WiFi network that the device is connected to.

Note: You must select at least one Wired Ports or Wireless check box. You can select more than one check box.

9. Click the **Add** button.
The VLAN tag group is added.
10. Click the **Apply** button.
Your settings are saved.

Set Up an IPTV Port to Lease an Intranet Port

You can set up the router to create an Internet Protocol television (IPTV) port that can lease an IP address from your IPTV service provider. Use this feature only if you subscribe to an IPTV service and your IPTV service requires an intranet address.

Some IPTV ports cannot work behind NAT because the IPTV port requires an IP address within the Internet service provider's network (intranet address). You can set up a bridge connection from the WAN to one of the LAN ports. When IPTV is connected through WiFi, the home router also must support the bridging of the WAN port to the WiFi network name (SSID). The designated LAN port or WiFi name becomes an IPTV port with direct access to the WAN without going through NAT.

To configure an IPTV port:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VLAN/Bridge Settings**.
The VLAN / Bridge Settings page displays.
5. Select the **Enable VLAN/Bridge Group** check box.
The page expands.
6. Select the **By bridge group** radio button.
The section expands.
7. Select a Wired Ports check box or a Wireless check box:
 - If your device is connected to an Ethernet port on the router, select the Wired Ports check box that corresponds to the Ethernet port on the router to which the device is connected.
 - If your device is connected to your router's WiFi network, select the Wireless check box that corresponds to the router's WiFi network to which the device is connected.

Note: You must select at least one Wired Ports or Wireless check box. You can select more than one check box.
8. Click the **Apply** button.
Your settings are saved.

Manage custom static routes

For almost all Internet traffic, routes are automatically and dynamically selected. You can also set up a fixed, static route. Typically, you only need to add static routes when you have more than one router or multiple IP subnets on your network.

As an example of when a static route is needed, consider the following case:

- Your main Internet access is through a cable modem to your ISP. The cable modem is connected to your router.
- Your network also includes an ADSL router that you use to access a remote office site. This ADSL router is connected to a DSL modem, which is used on-demand only.
- Your LAN subnet is 192.168.1.0, and the ADSL router's address on your LAN is 192.168.1.100.
- The public IP address range at the remote office site is 134.177.0.0.

When you set up your router, two implicit static routes were created:

1. A default route was created between your router and the cable modem that connects to your ISP.
2. A second static route was created between your router and your LAN for all 192.168.1.0 addresses.

With this configuration, if you try to access a device on the 134.177.0.0 network at the remote office site, your router forwards your request to your ISP. In turn, the ISP forwards your request to the remote office site, where the firewall will deny the request.

In this situation, you must define a static route, telling your router to access 134.177.0.0 addresses through your ADSL router at its LAN address of 192.168.1.100.

Here is an example static route setting for this configuration:

- **Destination IP address and subnet mask settings:** The route applies to all addresses at the remote site, so set the destination IP address to 134.177.0.0 and the subnet mask to 255.255.255.0.
- **Gateway IP address:** Traffic for addresses in the 134.177.0.0 network must be forwarded to the ADSL router, so set the gateway IP address to 192.168.1.100 (the ADSL router's address on your LAN).
- **Private route:** Make the static route private as a security precaution in case Routing Information Protocol (RIP) is activated. A private route is not reported in RIP messages.

Set up a static route

To set up a static route:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Static Routes**.

The Static Routes page displays.

5. Click the **Add** button.

The page adjusts.

6. In the **Route Name** field, type a name for this static route (for identification purposes only).

7. To limit access to the LAN only, select the **Private** check box.

If the **Private** check box is selected, the static route is not reported in RIP.

8. To prevent the route from becoming active, clear the **Active** check box.

In some situations, you might want to set up a static route but keep it disabled until a later time. By default, the **Active** check box is selected and a route becomes active after you click the **Apply** button.

9. Enter the following settings:

- **Destination IP Address.** Enter the IP address for the final destination of the route.
- **IP Subnet Mask.** Enter the IP subnet mask for the final destination of the route. If the destination is a single host, enter **255.255.255.255**.
- **Gateway IP Address.** Enter the IP address of the gateway. The IP address of the gateway must be on the same LAN segment as the router.
- **Metric.** Enter a number from 2 through 15. This value represents the number of routers between your network and the destination. Usually, a setting of 2 or 3 works.

10. Click the **Apply** button.

Your settings are saved. The static route is added to the table on the Static Routes page.

Edit a static route

To edit a static route:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Static Routes**.
The Static Routes page displays.
5. In the table, select the radio button for the route.
6. Click the **Edit** button.
The Static Routes page adjusts.
7. Edit the route information.
8. Click the **Apply** button.
Your settings are saved.

Delete a static route

To delete a static route:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Static Routes**.
The Static Routes page displays.
5. In the table, select the radio button for the route.
6. Click the **Delete** button.
The route is removed from the table.

Improve network connections with Universal Plug and Play

Universal Plug and Play (UPnP) helps devices such as Internet appliances and computers access the network and connect to other devices as needed. UPnP devices can automatically discover the services from other registered UPnP devices on the network. If you use applications such as multiplayer gaming, peer-to-peer connections, or real-time communications such as instant messaging or remote assistance, enable UPnP.

To enable Universal Plug and Play:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > UPnP**.
The UPnP page displays.
5. Select the **Turn UPnP On** check box.
By default, this check box is selected. UPnP for automatic device configuration can be enabled or disabled. If the **Turn UPnP On** check box is cleared, the router does not allow any device to automatically control router resources, such as port forwarding.
6. Type the advertisement period in minutes.
The advertisement period specifies how often the router broadcasts its UPnP information. This value can range from 1 to 1440 minutes. The default period is 30 minutes. Shorter durations ensure that control points receive current device status at the expense of more network traffic. Longer durations can compromise the freshness of the device status but can significantly reduce network traffic.
7. Type the advertisement time to live in hops.
The time to live for the advertisement is measured in hops (steps) for each UPnP packet sent. Hops are the steps a packet takes between routers. The number of hops can range from 1 to 255. The default value for the advertisement time to live is 4 hops, which should be fine for most home networks. If you notice that some devices

are not being updated or reached correctly, it might be necessary to increase this value.

8. Click the **Apply** button.

The UPnP Portmap Table displays the IP address of each UPnP device that is accessing the router and which ports (internal and external) that device opened. The UPnP Portmap Table also displays what type of port is open and whether that port is still active for each IP address.

To refresh the information in the UPnP Portmap Table, click the **Refresh** button.

Manage advanced WiFi settings

CAUTION: Take extra care changing advanced WiFi settings because incorrect configuration might affect the WiFi function of the router.

Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio

20/40 coexistence allows a 20 MHz and 40 MHz channel width to be supported simultaneously. By default, 20/40 MHz coexistence is enabled on the 2.4 GHz radio to prevent interference between WiFi networks in your environment at the expense of WiFi speed. If no other WiFi networks are present in your environment, you can disable 20/40 MHz coexistence to increase the WiFi speed on the 2.4 GHz radio to the maximum supported speed for the WiFi mode.

20/40 MHz coexistence applies to the 2.4 GHz radio.

To enable or disable 20/40 MHz coexistence for the 2.4 GHz radio:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Advanced Wireless Settings page displays.

5. Select or clear the **Enable 20/40 MHz Coexistence** check box.
Selecting this check box enables coexistence (the default setting) and clearing this check box disables coexistence.
6. Click the **Apply** button.
Your settings are saved.

Enable or disable implicit beamforming

Beamforming shapes a directional WiFi signal aimed at a WiFi client based on the client's location, as opposed to radiating the signal out in all directions. This feature improves WiFi range and performance. Clients do not need to support beamforming to benefit from implicit beamforming.

To enable or disable implicit beamforming:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays.
5. Select or clear the **Enable Implicit BEAMFORMING** check box.
Selecting this check box enables implicit beamforming. Clearing this check box disables implicit beamforming.
6. Click the **Apply** button.
Your settings are saved.

If you connected over WiFi to the network, you are disconnected from the network and must reconnect.

Enable or disable airtime fairness

Airtime fairness ensures that all WiFi clients receive equal time on the network. Network resources are divided by time, so if you have five WiFi clients, they each get one-fifth

of the network time. The advantage of this feature is that your slowest WiFi clients don't control network responsiveness. This feature is enabled by default, but you can disable it.

To enable or disable airtime fairness:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays.
5. Select or clear the **Enable AIRTIME FAIRNESS** check box.
Selecting this check box enables airtime fairness. Clearing this check box disables airtime fairness.
6. Click the **Apply** button.
Your settings are saved.
If you connected over WiFi to the network, you are disconnected from the network and must reconnect.

Enable bridge mode

You can use your router in bridge mode to connect multiple devices at the faster WiFi speed. You need two routers: one set up as a router and the other set up as a bridge.

Installing your router as a bridge offers the following benefits:

- Take advantage of gigabit WiFi speeds on current devices
- Use Gigabit WiFi for applications like video and gaming.
- Connect multiple devices like NAS, Smart TV, Blu-ray player, and game consoles at gigabit WiFi speeds using a WiFi link.
- Avoid the need for separate WiFi adapters for each device.

For example, you can install the first router in a room like a home office where your Internet connection is located. Then, set up the second router in bridge mode and place it in a different room such as the room where your home entertainment center is located.

Use Ethernet cables to connect the router in bridge mode to your Smart TV, DVR, game console, or other device.

To enable bridge mode:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays.
5. Select the **use other operation mode** check box.
6. Select the **Enable Bridge Mode** radio button.
7. Click the **setup bride mode wireless settings** button.
The Wireless Settings window opens.
8. Specify the settings of the other router to which this router will connect:
 - a. Select the wireless network from the menu:
 - **Wireless Networks (2.4Ghz b/g/n)**
 - **Wireless Networks (5Ghz a/n/ac)**
For 802.11ac or 802.11ax mode, select **5 GHz**.
 - b. In the **Name (SSID)** file, enter the wireless network name (SSID).
 - c. In the **Security Options** section, select a radio button.
 - d. If the **Password (Network Key)** field displays, type the WiFi password (network key) that you use to connect wirelessly to the other router.
9. Click the **Apply** button.
The window closes and you are returned to the main Wireless Settings page.
10. Click the **Apply** button on the main Wireless Settings page.
Your settings are saved.

Change the CTS/RTS threshold or preamble mode for a radio

For most WiFi networks, the fragmentation length, CTS/RTS threshold, and preamble mode work fine and we recommend that you do not change the settings. (In general, these settings are intended for WiFi testing.)

CAUTION: Do not change these settings unless directed by NETGEAR support or unless you are sure what the consequences are. Incorrect settings might disable the WiFi function of a radio unexpectedly.

To change the fragmentation length, CTS/RTS threshold, or preamble mode for a radio:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
 2. Enter **http://www.routerlogin.net**.
A login window opens.
 3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
 4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Advanced Wireless Settings page displays.
 5. In the **Fragmentation Length (256-2346)** field for a radio, enter a value from 255 to 2436.
The default value is 2346.
 6. In the **CTS/RTS threshold (1-2347)** field for a radio, enter a value from 1 to 2437.
The default value is 2347.
 7. From the **Preamble Mode** menu for a radio, select the preamble mode:
 - **Long Preamble:** A long transmit preamble might provide a more reliable connection or a slightly longer range.
 - **Short Preamble:** A short transmit preamble might give better performance.
- CAUTION:** Incorrect settings might disable the radio's WiFi broadcast unexpectedly.
8. Click the **Apply** button.

Your settings are saved.

6

Optimize Performance

You can set up the router to optimize performance for applications such as multiplayer gaming, peer-to-peer connections, or real-time communications such as instant messaging. Quality of Service (QoS) lets you assign a high priority to gaming traffic both to and from the Internet and to streaming video from the Internet.

By default, the router uses Wi-Fi Multimedia Quality of Service (WMM QoS).

This chapter contains the following sections:

- [Optimize Internet gaming with upstream QoS](#)
- [Add upstream QoS priority rules](#)
- [Optimize video streaming with downstream QoS](#)
- [Add downstream QoS priority rules](#)
- [Manage Wi-Fi Multimedia Quality of Service](#)

Optimize Internet gaming with upstream QoS

Upstream Quality of Service (QoS) assigns a high priority to Internet traffic from a device such as an Xbox gaming system.

Note: We recommend that only gamers enable the Upstream QoS feature. If you do not game and you turn on this feature, some applications might not perform as well as usual.

To enable upstream QoS:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Upstream QoS**.
The Upstream QoS page displays.
5. Select the **Enable Upstream QoS (Optimized for Gaming)** check box.
6. Specify the maximum uplink bandwidth for your Internet connection:
 - If you know what your uplink bandwidth is, type it in the **Uplink bandwidth Maximum** field and select **Kbps** or **Mbps** from the menu.
 - If you are not sure, click the **Speed Test** button.
Speedtest verifies the upstream speed of your Internet connection. The **Uplink bandwidth Maximum** field displays the result of the test.
7. Click the **Apply** button.
The router assigns a high priority to Internet traffic from your gaming devices to the Internet.

Add upstream QoS priority rules

You can give prioritized Internet access to the following types of traffic:

- Specific applications
- Specific online games
- Individual Ethernet LAN ports of the router
- A specific device by MAC address

To specify prioritization of traffic, create a policy for the type of traffic and add the policy to the router's QoS Priority Rule list. For convenience, the router's QoS Priority Rule list includes many common applications and online games that can benefit from QoS handling.

Set up an upstream QoS rule for an application or online game

You can create an upstream QoS policy rule for an application or online game.

To create an upstream QoS policy rule for an application or online game:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Upstream QoS**.
The Upstream QoS page displays.
5. Click the **Setup QoS rule** button.
The QoS Priority Rule list page displays.
6. To add a rule, scroll down to the bottom of the QoS Priority Rule list page and click the **Add Priority Rule** button.
The QoS - Priority Rules page displays.
7. In the **QoS Policy for** field, type the name of the application or game.

8. From the **Priority Category** menu, select either **Applications** or **Online Gaming**.
A list of applications or games displays.
9. Scroll and select **Add a New Application** or **Add a New Game**, as applicable.
10. If prompted, from the **Connection Type** menu, select either **TCP**, **UDP**, or **TCP/UDP** (both).
11. Specify the port number or range of port numbers that the application or game uses.
12. From the **Priority** menu, select the priority for upstream traffic for this application or game relative to other traffic.
The options are **Low**, **Normal**, **High**, and **Highest**.
13. Click the **Apply** button.
The rule is saved in the QoS Priority Rule list.

Set up an upstream QoS rule for a router LAN port

You can create an upstream QoS policy rule for a device that is connected to a LAN port of the router.

To create an upstream QoS policy rule for a device connected to one of the router's LAN ports:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Upstream QoS**.
The Upstream QoS page displays.
5. Click the **Setup QoS rule** button.
The QoS Priority Rule list page displays.
6. To add a rule, scroll down to the bottom of the QoS Priority Rule list page and click the **Add Priority Rule** button.
The QoS - Priority Rules page displays.

7. From the **Priority Category** menu, select **Ethernet LAN Port**.
The page adjusts.
8. From the **LAN Port** menu, select the LAN port.
The options are **1, 2, 3**, and **4**.
9. From the **Priority** menu, select the priority for upstream traffic on this port relative to other traffic.
The options are **Low, Normal, High**, and **Highest**.
10. Click the **Apply** button.
The rule is saved in the QoS Priority Rule list.

Set up an upstream QoS rule for a MAC address

You can create an upstream QoS policy rule for traffic from a MAC address of a device on the LAN.

To create an upstream QoS policy rule for traffic from a specific MAC address:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Upstream QoS**.
The Upstream QoS page displays.
5. Click the **Setup QoS rule** button.
The QoS Priority Rule list page displays.
6. To add a rule, scroll down to the bottom of the QoS Priority Rule list page and click the **Add Priority Rule** button.
The QoS - Priority Rules page displays.
7. From the **Priority Category** menu, select **MAC Address**.
The page adjusts.
8. If the device is in the MAC Device List, select its radio button.

The information from the MAC Device List populates the **QoS Policy for, MAC Address**, and **Device Name** fields. If the device is not in the MAC Device List, click the **Refresh** button. If it still does not display, complete these fields manually.

9. From the **Priority** menu, select the priority for upstream traffic from this MAC address relative to other traffic.

The options are **Low**, **Normal**, **High**, and **Highest**.

10. Click the **Apply** button.

The rule is saved in the QoS Priority Rule list.

Change an upstream QoS policy rule

You can change an existing upstream QoS policy rule.

To change an upstream QoS policy rule:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Setup > QoS Setup > Upstream QoS**.

The Upstream QoS page displays.

5. Click the **Setup QoS rule** button.

The QoS Priority Rule list page displays.

6. Select the radio button for the QoS policy rule.

7. Scroll down and click the **Edit** button.

The QoS - Priority Rules page displays.

8. Change the policy settings.

9. Click the **Apply** button.

Your settings are saved.

Delete an upstream QoS policy rule

You can delete an upstream QoS policy rule that you no longer need.

To delete an upstream QoS policy rule:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Upstream QoS**.
The Upstream QoS page displays.
5. Click the **Setup QoS rule** button.
The QoS Priority Rule list page displays.
6. Select the radio button for the QoS policy rule.
7. Scroll down and click the **Delete** button.
The rule is removed from the QoS Priority Rule list.

Delete all upstream QoS policy rules

You can permanently remove all custom and default upstream QoS policy rules.

The only way to restore the default upstream QoS policy rules after you deleted them is by returning the router to factory default settings.

To delete all upstream QoS policy rules:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Setup > QoS Setup > Upstream QoS**.

The Upstream QoS page displays.

5. Click the **Setup QoS rule** button.

The QoS Priority Rule list page displays.

6. Scroll down and click the **Delete All** button.

All rules are removed from the QoS Priority Rule list.

Optimize video streaming with downstream QoS

Downstream Quality of Service (QoS) assigns a high priority to Internet video streaming from websites like YouTube and Netflix.

We recommend that you enable downstream QoS only if you watch streaming Internet video. When downstream QoS assigns a high priority to streaming video, it also assigns a lower priority to the rest of your Internet traffic. That means that other tasks such as downloading content from the Internet take longer.

To enable downstream QoS:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Setup > QoS Setup > Downstream QoS**.

Downstream QoS

5. Select the **Enable Downstream QoS (Improved Video Streaming)** check box.

6. (Optional) Select the **Streaming Database Auto Update** check box.

The router automatically checks for updates for the streaming database and downloads and installs them.

Note: You can also manually update the streaming database by clicking the **Manual Update** button and following the instructions onscreen.

7. Click the **Apply** button.

The page adjusts and displays the default QoS downstream priority rules for video streaming services to which the router now assigns a high priority.

Add downstream QoS priority rules

The streaming database contains downstream QoS priority rules for common video streaming services. You cannot change or delete these default services. However, you can add custom downstream QoS priority rules for video streaming traffic based on the following components:

- A specific keyword
- A specific device by MAC address

To specify prioritization of streaming traffic, create a policy for a keyword or MAC address and add the policy to the router's QoS rule table.

Add a downstream QoS policy rule by keyword

After you enable downstream QoS (see [Optimize video streaming with downstream QoS](#) on page 99), you can add a custom downstream QoS priority rule for video streaming traffic based on a specific keyword.

To add a downstream QoS priority rule by keyword:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Downstream QoS**.
Downstream QoS page displays.
5. In the Add Rules section, leave the **by Keyword** radio button selected.

6. In the **Rule Name** field, type the name of the rule.
7. In the **Keyword** field, type a keyword.
8. Click the **Add** button.
The rule is added to the QoS Rule table. If video streaming traffic from the server on the Internet matches the keyword, the router assigns a high priority to the traffic.
9. Click the **Apply** button.
Your settings are saved.

Add a downstream QoS policy rule by MAC address

After you enable downstream QoS (see [Optimize video streaming with downstream QoS](#) on page 99), you can add a custom downstream QoS priority rule for video streaming traffic based on a MAC address.

To add a downstream QoS priority rule by MAC address:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Downstream QoS**.
Downstream QoS page displays.
5. If the device is in the MAC Device List, select its radio button.
The information from the MAC Device List populates the **Rule Name**, **MAC Address**, and **Device Name** fields. If the device is not in the MAC Device List, complete these fields manually.
6. Click the **Add** button.
7. Click the **Apply** button.
The rule is added to the QoS Rule table. The router assigns a high priority to video streaming traffic from the server on the Internet to the device for which you specified the MAC address.

Change a downstream QoS policy rule

You can change a custom downstream QoS policy rule.

To change a custom downstream QoS policy rule:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Downstream QoS**.
Downstream QoS page displays.
5. In the QoS Rule table, select the QoS policy rule.
The fields are populated automatically, enabling you to change the policy settings.
6. Change the policy settings.
7. Click the **Edit** button.
8. Change the settings.
9. Click the **Apply** button.
Your settings are saved.

Delete a downstream QoS policy rule

You can delete a custom downstream QoS policy rule that you no longer need.

To delete a custom downstream QoS policy rule:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Setup > QoS Setup > Downstream QoS**.
Downstream QoS page displays.
5. In the QoS Rule table, select the QoS policy rule.
6. Click the **Delete** button.
7. Click the **Apply** button.
The rule is removed from the QoS Rule table.

Delete all downstream QoS policy rules

You can delete all custom downstream QoS policy rules. You cannot delete default rules that were downloaded from the streaming database.

To delete all custom downstream QoS policy rules:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup > Downstream QoS**.
Downstream QoS page displays.
5. Click the **Delete All** button.
6. Click the **Apply** button.
All custom rules are removed from the QoS Rule table.

Manage Wi-Fi Multimedia Quality of Service

Wi-Fi Multimedia Quality of Service (WMM QoS) prioritizes WiFi voice and video traffic over the WiFi link. WMM QoS is automatically enabled for the router.

WMM QoS prioritizes WiFi data packets from different applications based on four access categories: voice, video, best effort, and background. For an application to receive the

benefits of WMM QoS, WMM must be enabled for both it and the client running that application. Legacy applications that do not support WMM and applications that do not require QoS are assigned to the best effort category, which receives a lower priority than voice and video. Circumstances might occur in which you want to disable WMM QoS.

To disable WMM QoS:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup**.
The **WMM** tab is automatically selected and the WMM page displays.
5. Clear the **Enable WMM (Wi-Fi multimedia) settings (2.4GHz b/g/n)** check box.
6. Clear the **Enable WMM (Wi-Fi multimedia) settings (5GHz a/n/ac)** check box.
7. Click the **Apply** button.
Your settings are saved.

7

Manage Your Router

This chapter describes the router settings for administering and maintaining your router and home network.

The chapter includes the following sections:

- [Update the router firmware](#)
- [Change the admin Password](#)
- [Enable admin password reset](#)
- [Reset the admin password](#)
- [Always use HTTPS to access the router](#)
- [View Devices Currently on the Network](#)
- [Manage the Router Configuration File](#)
- [Return the router to its factory default settings](#)
- [View the Status and Statistics of the Router](#)
- [Manage the Activity Log](#)
- [Monitor and Meter Internet Traffic](#)
- [Set the NTP server](#)
- [Set your time zone and daylight saving time](#)
- [Connect to your router with Anywhere Access](#)
- [Disable or Enable LED Blinking or Turn Off LEDs](#)

Update the router firmware

You can log in to the router and check if new firmware is available, or you can manually load a specific firmware version to your router.

Check for new firmware and update the router

The router firmware (routing software) is stored in flash memory. You might see a message at the top of the router pages when new firmware is available. You can respond to that message to update the firmware or you can check to see if new firmware is available and update your product.

Note: We recommend that you connect a computer to the router using an Ethernet connection to update the firmware.

To check for new firmware and update your router:

1. Launch a web browser from a computer that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Router Update**.
The Router Update page displays.
5. Click the **Check** button.
The router finds new firmware information if any is available and displays a message asking if you want to download and install it.
6. Click the **Yes** button.
The router locates and downloads the firmware and begins the update.

WARNING: To avoid the risk of corrupting the firmware, do not interrupt the update. For example, do not close the browser, click a link, or load a new page. Do not turn off the router.

When the upload is complete, your router restarts. The update process typically takes about one minute. Read the new firmware release notes to find out if you must reconfigure the router after updating.

Manually upload firmware to the router

If you want to upload a specific firmware version, or your router fails to update its firmware automatically, follow these instructions.

Note: We recommend that you connect a computer to the router using an Ethernet connection to upload the firmware.

To manually upload a firmware file to your router:

1. Download the firmware for your router from the [NETGEAR Download Center](#), save it to your desktop, and unzip the file if needed.

Note: The correct firmware file uses an `.img` or `.chk` extension.

2. Launch a web browser from a computer that is connected to the router network.
3. Enter **http://www.routerlogin.net**.
A login window opens.
4. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
5. Select **ADVANCED > Administration > Router Update**.
The Router Update page displays.
6. Click the **Browse** button.
7. Find and select the firmware file on your computer.
8. Click the **Upload** button.
The router begins the upload.

WARNING: To avoid the risk of corrupting the firmware, do not interrupt the update. For example, do not close the browser, click a link, or load a new page. Do not turn off the router. Wait until the router finishes restarting. If your router does not reboot, check the Router Status page to confirm whether the new firmware version uploaded.

Change the admin Password

You can change the default password that is used to log in to the router with the user name admin. This password is not the one that you use for WiFi access.

Note: Be sure to change the password for the user name admin to a secure password. The ideal password contains no dictionary words from any language and contains uppercase and lowercase letters, numbers, and symbols. It can be up to 30 characters.

To change the admin user name and enable password recovery:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Set Password**.
The Set Password page displays.
5. Type the old password in the **Old Password** field.
6. Type the new password in the **Set Password** and **Repeat New Password** fields.
7. Click the **Apply** button.
Your settings are saved.

Enable admin password reset

The router admin password is used to log in to your router web interface. We recommend that you enable password reset so that you can reset the password if you forget it. This reset process is supported in Chrome, Safari, Firefox, Edge, and Internet Explorer.

To enable password reset:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Set Password**.
The Set Password page displays.
5. Select the **Enable Password Reset** check box.
6. Select two security questions and provide answers to them.
7. Click the **Apply** button.
Your settings are saved.

Reset the admin password

If you set up the password reset feature, you can reset your router admin password if you forgot it. This reset process is supported in Chrome, Safari, Firefox, Edge, and Internet Explorer.

To reset your router admin password:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Click the **Cancel** button.
If password reset is enabled, you are prompted to enter the serial number of the router.
The serial number is on the router label.
4. Enter the serial number of the router.
5. Click the **Continue** button.
The Router Password Reset page displays.
6. Enter the answers to your security questions.
7. Click the **Continue** button.
The page adjusts.

8. Type a new admin password, confirm your new password, and set new security questions and answers.
9. Click the **Next** button.
The page displays a confirmation.
10. Click the **Login** button.
A login window opens.
11. With your new password, log in to the router.

Always use HTTPS to access the router

You can configure the router to require HTTPS connections between your web browser and the router web interface, for example, "https://www.routerlogin.net". When you enable the HTTPS requirement, connection requests to the router web interface that specify HTTP are automatically converted to HTTPS.

Note: After you enable the HTTPS requirement, when you enter **http://www.routerlogin.net**, your browser might display a security warning because of the self-signed certificate on the router. This is expected behavior. You can proceed, or add an exception for the security warning. For more information, visit <https://kb.netgear.com/000062980/what-to-do-in-case-of-security-message>.

To require HTTPS connections:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Web Services Management**.
The Web Services Management page displays.
5. Select the **Always Use HTTPS to Access Router** check box.
6. Click the **Apply** button.
Your settings are saved.

View Devices Currently on the Network

You can view all computers or devices that are currently connected to your network.

To view devices on the network:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **Attached Devices**.
The following information is displayed:
 - **Connection Type**. Wired or the WiFi band for the connection.
 - **Device Name**. If the device name is known, it is shown here.
 - **IP Address**. The IP address that the router assigned to this device when it joined the network. This number can change if a device is disconnected and rejoins the network.
 - **MAC Address**. The unique MAC address for each device does not change. The MAC address is typically shown on the product label.
5. To update this page, click the **Refresh** button.

Manage the Router Configuration File

The configuration settings of the router are stored within the router in a configuration file. You can back up (save) this file to your computer, restore it, or reset it to the factory default settings.

Back Up Settings

To back up the router's configuration settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Backup Settings**.
The Backup Settings page displays.
5. Click the **Back Up** button.
6. Follow the direction of your browser to save the file.
A copy of the current settings is saved in the location that you specified.

Erase the Current Configuration Settings

You can erase the current configuration and restore the factory default settings. You might want to do this if you move the router to a different network.

To erase the configuration settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Backup Settings**.
The Backup Settings page displays.
5. Click the **Erase** button.

The factory default settings are restored. The user name is admin, the password is password, and the LAN IP address is 192.168.1.1. DHCP is enabled.

Restore Configuration Settings

To restore configuration settings that you backed up:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Backup Settings**.
The Backup Settings page displays.
5. Click the **Browse** button to find and select the `.cfg` file.
6. Click the **Restore** button.
The file is uploaded to the router and the router reboots.

WARNING: Do not interrupt the reboot process.

Return the router to its factory default settings

Under some circumstances (for example, if you lost track of the changes that you made to the router settings or you move the router to a different network), you might want to erase the configuration and reset the router to factory default settings.

To reset the router to factory default settings, you can use either the **Reset** button on the back of the router or the Erase function.

After you reset the router to factory default settings, the user name is admin, the password is password, the LAN IP address is 192.168.1.1 (which is the same as www.routerlogin.net), and the DHCP server is enabled.

Note: If the router is in access point mode or bridge mode and you do not know the IP address that is assigned to it, first try to use an IP scanner application to detect the IP address. (IP scanner applications are available online free of charge.) If you can detect the IP address, you don't need to reset the router to factory default settings.

Use the Reset button

CAUTION: This process erases all settings that you configured in the router.

To reset the router to factory default settings:

1. On the back of the router, locate the **Reset** button.
2. Using a straightened paper clip, press and hold the **Reset** button for at least five seconds.
3. Release the **Reset** button.

The Power LED starts blinking. When the reset is complete, the router restarts. This process takes about two minutes.

WARNING: To avoid the risk of corrupting the firmware, do not interrupt the reset. For example, if you are connected to the router web interface, do not close the browser, click a link, or load a new page. Do not turn off the router. Wait until the router finishes restarting.

Erase the settings

CAUTION: This process erases all settings that you configured in the router.

To erase the settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Backup Settings**.
The Backup Settings page displays.

5. Click the **Erase** button.

The configuration is reset to factory default settings. When the reset is complete, the router restarts. This process takes about two minutes.

WARNING: To avoid the risk of corrupting the firmware, do not interrupt the reset. For example, do not close the browser, click a link, or load a new page. Do not turn off the router. Wait until the router finishes restarting.

View the Status and Statistics of the Router

You can view information about the router and its ports and the status of the Internet connection and WiFi network. In addition, you can view traffic statistics for the various ports.

View information about the router and the Internet and WiFi settings

You can view router information, the Internet port status, and WiFi settings.

To view information about the router and the Internet, modem, and WiFi settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Click the **ADVANCED** tab.

The ADVANCED Home page displays.

The information on this page uses the following color coding:

- A green icon indicates that the Internet connection is fine and no problems exist. For a WiFi network, the network is enabled and secured.
- A red icon indicates that configuration problems exist for the Internet connection or the connection is down. For a WiFi network, the network is disabled or down.

- An amber icon indicates that the Internet port is configured but cannot get an Internet connection (for example, because the cable is disconnected), that a WiFi network is enabled but unprotected, or that another situation that requires your attention occurred.

Display the statistics of the Internet port

To display the statistics of the Internet port:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Click the **ADVANCED** tab.
The ADVANCED Home page displays.
5. In the Internet Port pane, click the **Show Statistics** button.
The Show Statistics window opens and displays following information:
 - **System Up Time**. The time elapsed since the router was last restarted.
 - **Port**. The statistics for the WAN (Internet) port, LAN (Ethernet) ports, and WLANs. For each port, the window displays the following information:
 - **Status**. The link status of the port.
 - **TxPkts**. The number of packets transmitted on this port since the router was last started.
 - **RxPkts**. The number of packets received on this port since the router was last started.
 - **Collisions**. The number of collisions on this port since the router was last started.
 - **Tx B/s**. The current transmission (outbound) bandwidth used on the WAN and LAN ports.
 - **Rx B/s**. The current reception (inbound) bandwidth used on the WAN and LAN ports.
 - **Up Time**. The time elapsed since this port acquired the link.

- **Poll Interval.** The interval at which the statistics are updated on this page.
6. To change the polling frequency, enter a time in seconds in the **Poll Interval** field and click the **Set Interval** button.
To stop the polling entirely, click the **Stop** button.

Check the Internet connection status

To check the Internet connection status:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Click the **ADVANCED** tab.
The ADVANCED Home page displays.
5. In the Internet Port pane, click the **Connection Status** button.
The Connection Status window opens. The information that displays depends on the type of Internet connection.

For example, if your Internet connection does not require a login and the router receives an IP address automatically, the window displays the following information:

- **IP Address.** The IP address that is assigned to the router.
- **Subnet Mask.** The subnet mask that is assigned to the router.
- **Default Gateway.** The IP address for the default gateway that the router communicates with.
- **DHCP Server.** The IP address for the Dynamic Host Configuration Protocol server that provides the TCP/IP configuration for all the computers that are connected to the router.
- **DNS Server.** The IP address of the Domain Name Service server that provides translation of network names to IP addresses.
- **Lease Obtained.** The date and time when the lease was obtained.

- **Lease Expires.** The date and time that the lease expires.
6. To release (stop) the Internet connection, click the **Release** button.
 7. To renew (restart) the Internet connection, click the **Renew** button.
 8. To exit the screen, click the **Close Window** button.

Manage the Activity Log

The log is a detailed record of the websites that users on your network accessed or attempted to access and many other router actions. Up to 256 entries are stored in the log. You can manage which activities are logged.

View, Email, or Clear the Logs

In addition to viewing the logs, you can email them and clear them.

To view, email, or clear the logs:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Logs**.
The Logs page displays the following information:
 - **Action.** The action that occurred, such as whether Internet access was blocked or allowed.
 - **Source.** The name, IP address, or MAC address of the target device, application, or website for this log entry.
 - **Target.** The name, IP address, or MAC address of the target device, application, or website for this log entry.
 - **Date and Time.** The date and time at which the action occurred.
5. To refresh the log entries onscreen, click the **Refresh** button.

6. To clear the log entries, click the **Clear Log** button.
7. To email the log immediately, click the **Send Log** button.
The router emails the logs to the address that you specified (see [Set up security event email notifications](#) on page 54).

Specify Which Activities Are Logged

You can specify which activities are logged. These activities display in the log and are forwarded to the syslog server if you enabled the syslog server function.

To manage which activities are logged:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > Logs**.
The Logs page displays.
5. Select the check boxes that correspond to the activities that you want to be logged.
By default, all check boxes are selected.
6. Clear the check boxes that correspond to the activities that you do not want to be logged.
7. Click the **Apply** button.
Your settings are saved.

Monitor and Meter Internet Traffic

Traffic metering allows you to monitor the volume of Internet traffic that passes through the router Internet port. With the traffic meter utility, you can set limits for traffic volume, set a monthly limit, and get a live update of traffic usage.

Start the Traffic Meter Without Traffic Volume Restrictions

You can monitor the traffic volume without setting a limit.

To start or restart the traffic meter without configuring traffic volume restrictions:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**.
The Traffic Meter page displays.
5. Select the **Enable Traffic Meter** check box.
By default, no traffic limit is specified and the traffic volume is not controlled.
6. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.
7. To start the traffic counter immediately, click the **Restart Counter Now** button.
8. Click the **Apply** button.
Your settings are saved and the router restarts.

The Internet Traffic Statistics section helps you to monitor the data traffic. For more information, see [View the Internet Traffic Volume and Statistics](#) on page 123.

Restrict Internet Traffic by Volume

You can record and restrict the traffic by volume in MB. This is useful when your ISP measures your traffic in volume.

To record and restrict the Internet traffic by volume:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**.
The Traffic Meter page displays.
5. Select the **Enable Traffic Meter** check box.
6. Select the **Traffic volume control by** radio button.
7. From the corresponding menu, select an option:
 - **Download only**. The restriction is applied to incoming traffic only.
 - **Both Directions**. The restriction is applied to both incoming and outgoing traffic.
8. In the **Monthly Limit** field, enter how many MBytes (MB) per month are allowed.
9. If your ISP charges you for extra data volume when you make a new connection, enter the extra data volume in MB in the **Round up data volume for each connection by** field.
10. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.
11. In the Traffic Control section, enter a value in minutes to specify when the router issues a warning message before the monthly limit in hours is reached.
This setting is optional. The router issues a warning when the balance falls below the number of minutes that you enter. By default, the value is 0 and no warning message is issued.
12. Select one or more of the following actions to occur when the limit is reached:
 - **Turn the Internet LED to flashing white/amber**. This setting is optional. When the traffic limit is reached, the Internet LED alternates blinking white and amber.

- **Disconnect and disable the Internet connection.** This setting is optional. When the traffic limit is reached, the Internet connection is disconnected and disabled.

13. Click the **Apply** button.

Your settings are saved and the router restarts.

The Internet Traffic Statistics section helps you to monitor the data traffic.

Restrict Internet Traffic by Connection Time

You can record and restrict the traffic by connection time. This is useful when your ISP measures your connection time.

To record and restrict the Internet traffic by connection time:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**.
The Traffic Meter page displays.
5. Select the **Enable Traffic Meter** check box.
6. Select the **Connection time control** radio button.

Note: The router must be connected to the Internet for you to be able to select the **Connection time control** radio button.

7. In the **Monthly Limit** field, enter how many hours per month are allowed.

Note: The router must be connected to the Internet for you to be able to enter information in the **Monthly Limit** field.

8. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.
9. In the Traffic Control section, enter a value in minutes to specify when the router issues a warning message before the monthly limit in hours is reached.

This setting is optional. The router issues a warning when the balance falls under the number of minutes that you enter. By default, the value is 0 and no warning message is issued.

10. Select one or more of the following actions to occur when the limit is reached:
 - **Turn the Internet LED to flashing white/amber.** This setting is optional. When the traffic limit is reached, the Internet LED alternates blinking white and amber.
 - **Disconnect and disable the Internet connection.** This setting is optional. When the traffic limit is reached, the Internet connection is disconnected and disabled.
11. Click the **Apply** button.

Your settings are saved and the router restarts.

The Internet Traffic Statistics section helps you to monitor the data traffic.

View the Internet Traffic Volume and Statistics

If you enabled the traffic meter, you can view the Internet traffic volume and statistics.

To view the Internet traffic volume and statistics shown by the traffic meter:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.

A login window opens.
3. Enter the router user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**.

The Traffic Meter page displays.
5. Scroll down to the Internet Traffic Statistics section.

The Internet Traffic Statistics section displays when the traffic counter was started and what the traffic balance is. The table displays information about the connection time and traffic volume in MB.
6. To refresh the information on the page, click the **Refresh** button.

The information is updated.
7. To display more information about the data traffic and to change the polling interval, click the **Traffic Status** button.

The Traffic Status pop-up window displays.

Unblock the Traffic Meter After the Traffic Limit Is Reached

If you configured the traffic meter to disconnect and disable the Internet connection after the traffic limit is reached, you cannot access the Internet until you unblock the traffic meter.

CAUTION: If your ISP set a traffic limit, your ISP might charge you for the overage traffic.

To unblock the traffic meter:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**.
The Traffic Meter page displays.
5. In the Traffic Control section, clear the **Disconnect and disable the Internet connection** check box.
6. Click the **Apply** button.
Your settings are saved and the router restarts.

Set the NTP server

By default, the router uses the NETGEAR Network Time Protocol (NTP) server to sync the network time. You can change the NTP server to your preferred NTP server.

To set the NTP server:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > NTP Settings**.
The NTP Settings page displays.
5. Select an NTP server radio button:
 - **Use the default NETGEAR NTP server:** Use the preset NETGEAR NTP server.
 - **Set your preferred NTP server:** Enter the name or IP address of your preferred server.
6. If you selected the **Set your preferred NTP server** radio button, enter the NTP server domain name or IP address in the **Server Address** field.
7. Click the **Apply** button.
Your settings are saved.

Set your time zone and daylight saving time

To set your time zone and daylight saving time:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Administration > NTP Settings**.
The NTP Settings page displays.
5. Select your time zone from the menu.
6. If you live in a region that observes daylight saving time, select the **Automatically adjust for daylight savings time** check box.
7. Click the **Apply** button.

Your settings are saved.

Connect to your router with Anywhere Access

The Anywhere Access feature on the Nighthawk app allows you to connect to your router when you're away from home and change its settings. Before you can use the Anywhere Access feature on the Nighthawk app, you must update your router's firmware and download the latest Nighthawk app for your mobile device.

For more information about how to update your router's firmware, see [Check for new firmware and update the router](#) on page 106.

To download the latest Nighthawk app for your mobile device, visit <https://www.netgear.com/home/apps-services/nighthawk-app/>.

Disable or Enable LED Blinking or Turn Off LEDs

Log in to the router to disable or enable LED blinking. You can also turn off the LEDs.

To disable LED blinking or turn off the LEDs using the router's web interface:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > LED Control Settings**.
The LED Control Settings page displays.

5. Select an LED control setting:
 - **Enable blinking on Internet LED, LAN LED, Wireless LED and USB LED when data traffic is detected.** Allows standard LED behavior. This setting is enabled by default.
 - **Disable blinking on Internet LED, LAN LED, Wireless LED and USB LED when data traffic is detected.** Blinking is disabled when data traffic is detected.
 - **Turn off all LEDs except Power LED.** All the LEDs, except the Power LED, are turned off.
6. Click the **Apply** button.
Your settings are saved.

8

Share USB Storage Devices Attached to the Router

This chapter describes how to access and manage storage devices attached to your router. ReadySHARE lets you access and share USB storage devices connected to the router. (If your storage device uses special drivers, it is not compatible.)

Note: The USB ports on the router can be used only to connect USB storage devices like flash drives or hard drives. Do not connect computers, USB modems, CD drives, or DVD drives to the router USB port.

This chapter contains the following sections:

- [USB device requirements](#)
- [Connect a USB storage device to the router](#)
- [Access a storage device connected to the router](#)
- [Map a USB device to a Windows network drive](#)
- [Back up Mac computers with Time Machine](#)
- [Manage Access to a Storage Device](#)
- [Approve a USB storage device](#)
- [Enable FTP access within your network](#)
- [View network folders on a storage device](#)
- [Add a network folder on a USB storage device](#)
- [Edit a network folder on a USB storage device](#)
- [Safely remove a USB storage device](#)

For more information about ReadySHARE features, visit netgear.com/readyshare.

USB device requirements

The router works with most USB-compliant external flash and hard drives. For the most up-to-date list of USB devices that the router supports, visit

kb.netgear.com/app/answers/detail/a_id/18985/~/readyshare-usb-drives-compatibility-list.

Some USB external hard drives and flash drives require you to load the drivers onto the computer before the computer can access the USB storage device. Such USB storage devices do not work with the router.

The router supports the following file system types for full read/write access:

- FAT16
- FAT32
- NTFS
- NTFS with compression format enabled
- Ext2
- Ext3
- Ext4
- HFS
- HFS+

Connect a USB storage device to the router

ReadySHARE lets you access and share USB storage devices that are connected to a USB port on the router. (If your USB storage device uses special drivers, it is not compatible.)

To connect a USB device:

1. Insert your USB storage device into a USB port on the router.
2. If your USB storage device uses a power supply, connect it.

You must use the power supply when you connect the USB storage device to the router.

When you connect the USB storage device to the router USB port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

Access a storage device connected to the router

From a computer or device on the network, you can access a storage device that is connected to the router.

Access a storage device connected to the router from a Windows-based computer

To access the USB storage device from a Windows-based computer:

1. Connect a USB storage device to a USB port on your router.
2. If your USB storage device uses a power supply, connect it.
You must use the power supply when you connect the USB storage device to the router.

When you connect the USB storage device to the router's port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

3. Select **Start > Run**.
4. Enter **\\readyshare** in the dialog box.
5. Click the **OK** button.
A window automatically opens and displays the files and folders on the USB storage device.

Access a storage device that is connected to the router from a Mac

From a computer or device on the network, you can access a storage device that is connected to the router.

To access the device from a Mac:

1. Connect a USB storage device to a USB port on your router.
2. If your USB storage device uses a power supply, connect it.
You must use the power supply when you connect the USB storage device to the router.

When you connect the USB storage device to the router's port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

3. On a Mac that is connected to the network, select **Go > Connect to Server**.
The Connect to Server window opens.
4. In the **Server Address** field, enter **smb://readyshare**.
5. When prompted, select the **Guest** radio button.
If you set up access control on the router and you allowed your Mac to access the network, select the **Registered User** radio button and enter **admin** for the name and router admin password for the password. For more information about access control, see [Network access control list](#) on page 43.
6. Click the **Connect** button.
A window automatically opens and displays the files and folders on the USB storage device.

Map a USB device to a Windows network drive

To map the USB storage device to a Windows network drive:

1. Connect a USB storage device to a USB port on your router.
2. If your USB storage device uses a power supply, connect it.
You must use the power supply when you connect the USB storage device to the router.

When you connect the USB storage device to the router's port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).
3. Select **Start > Run**.
4. Enter **\\readyshare** in the dialog box.
5. Click the **OK** button.
A window automatically opens and displays the USB storage device.
6. Right-click the USB device and select **Map network drive**.
The Map Network Drive window opens.
7. Select the drive letter to map to the new network folder.

8. Click the **Finish** button.
The USB storage device is mapped to the drive letter that you specified.
9. To connect to the USB storage device as a different user, select the **Connect using different credentials** check box, click the **Finish** button, and do the following:
 - a. Type the user name and password.
 - b. Click the **OK** button.

Back up Mac computers with Time Machine

You can use Time Machine to back up your Mac computers onto a USB hard drive that is connected to a USB port on the router. You can access the connected storage device from your Mac with a wired or WiFi connection to your router.

Note: The following instructions might be different depending on the macOS your computer is using. For more instructions about backing up your computer with Time Machine, see the Apple support site.

Set up a USB hard drive on a Mac

We recommend that you use a new USB HDD or format your old USB HDD to do the Time Machine backup for the first time. Use a blank partition to prevent some issues during backup using Time Machine. The router supports GUID or MBR partitions.

To format your USB hard disk drive and specify partitions:

1. Physically connect the USB HDD to your router.
2. If your USB HDD uses a power supply, connect it.
You must use the power supply when you connect the USB HDD to the router.

When you connect the USB HDD to the router's port, it might take up to two minutes before it is ready for sharing. By default, the USB HDD is available to all computers on your local area network (LAN).
3. On your Mac, go to **Spotlight** (or the magnifying glass) at the top right of the page and search for Disk Utility.
4. Open the Disk Utility, select your USB HDD, click the **Erase** tab, and click the **Erase** button.
5. Click the **Partition** tab.
6. In the **Partition Layout** menu, set the number of partitions that you want to use.

7. Click the **Options** button.
The Partition schemes display.
8. Select the **GUID Partition Table** or **Master Boot Record** radio button.
9. In the **Format** menu, select **Mac OS Extended (Journaled)**.
10. Click the **OK** button.
11. Click the **Apply** button.
Your settings are saved.

Prepare to back up a large amount of data

Before you back up a large amount of data with Time Machine, we recommend that you follow this procedure.

To prepare to back up a large amount of data:

1. Upgrade the operating system of the Mac computer.
2. Verify and repair the backup disk and the local disk.
3. Verify and repair the permissions on the local disk.
4. Set Energy Saver:
 - a. From the **Apple** menu, select **System Preferences**.
The System Preferences page displays.
 - b. Select **Energy Saver**.
The Energy Saver page displays.
 - c. Click the **Power Adapter** tab.
 - d. Select the **Wake for Wi-Fi network access** check box.
 - e. Click the **back arrow** to save the changes and exit the page.
5. Modify your security settings:
 - a. On the **System Preferences** page, select **Security & Privacy**.
The Security & Privacy page displays.
 - b. Click the **Advanced** button at the bottom of the page.
If the **Advanced** button is grayed out, click the lock icon so that you can change the settings.
 - c. Clear the **Log out after minutes of inactivity** check box.
 - d. Click the **OK** button.
Your settings are saved.

Use Time Machine to back up onto a USB hard disk

You can use Time Machine to back up your Mac computers onto a USB hard disk drive (HDD) that is connected to a USB port on the router.

To back up your Mac onto a USB hard disk drive:

1. Prepare your USB device with a compatible format and partitions.
For more information, see [Set up a USB hard drive on a Mac](#) on page 132.
2. If you plan to back up a large amount of data, see [Prepare to back up a large amount of data](#) on page 133.
3. If your USB HDD uses a power supply, connect it.
You must use the power supply when you connect the USB HDD to the router.
When you connect the USB HDD to the router's port, it might take up to two minutes before it is ready for sharing. By default, the USB HDD is available to all computers on your local area network (LAN).
4. On a Mac computer that is connected to the network, launch Finder and select **Go > Connect to Server**.
The Connect to Server window opens.
5. Type **smb://routerlogin.net** and click the **Connect** button.
6. When prompted, select the **Registered User** radio button.
7. Enter **admin** for the name and the router admin password for the password and click the **Connect** button.
A list of USB devices connected to your router displays.
8. From the **Apple** menu, select **System Preferences**.
The System Preferences window displays.
9. Select **Time Machine**.
The Time Machine window displays.
10. Click the **Select Backup Disk** button and select your USB HDD from the list.
11. Click the **Use Disk** button.

Note: If you do not see the USB partition that you want in the Time Machine disk list, go to Mac Finder and click that USB partition. It displays in the Time Machine list.

12. When prompted, select the **Registered User** radio button.

13. Enter **admin** for the name and the router admin password for the password and click the **Connect** button.

When the setup is complete, the Mac automatically schedules a full backup. You can back up immediately.

Manage Access to a Storage Device

You can specify the device name, workgroups, and network folders for a storage device connected to the USB port on the router.

To specify the storage device access settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > USB Functions > ReadySHARE Storage**.
The USB Storage (Advanced Settings) page displays.
5. To specify a name that is used to access the USB device or devices that are connected to the router, in the **Network/Device Name** field, enter a name.
By default, the name is readyshare.
6. To specify a name for the workgroup that the USB device or devices are members of, in the **Workgroup** field, enter a name.
By default, the name is Workgroup. The name works only in an operating system that supports NetBIOS, such as Microsoft Windows. If you are using a Windows workgroup rather than a domain, the workgroup name is displayed here.
7. Enable or disable access methods by selecting or clearing the corresponding check boxes and specifying access to the storage device as described in the following table.

Nighthawk AC1750 Smart WiFi Router

Access Method	Description
Network Connection	Enabled by default. You can type <code>\\readyshare</code> to access the storage device within your network. If you change the name in the Network/Device Name field from readyshare to another name, the link changes accordingly. You can enable password protection.
HTTP	Enabled by default. You can type <code>http://readyshare.routerlogin.net/shares</code> to access the USB device within your network and download or upload files. In this URL, readyshare is the name that is specified in the Network/Device Name field. If you change the name in the Network/Device Name field from readyshare to another name, the link changes accordingly. You can also click the link that is shown in the Link column. The fixed port is number is 80. You can enable password protection.
HTTPS (via internet)	Disabled by default. If you enable this feature, remote users can type <code>https://<public IP address>/shares</code> to access the USB device over the Internet. <code><public IP address></code> is the external or public IP address that is assigned to the router (for example, 1.1.10.102). This feature supports file uploading only. The default port is number 443, which you can change. Password protection is enabled by default.
FTP	Enabled by default. You can type <code>ftp://readyshare.routerlogin.net/shares</code> to access the USB device within your network and download or upload files. In this URL, readyshare is the name that is specified in the Network/Device Name field. If you change the name in the Network/Device Name field from readyshare to another name, the link changes accordingly. You can also click the link that is shown in the Link column. The fixed port is number is 21. You can enable password protection.
FTP (via internet)	Disabled by default. If you enable this feature, remote users can type <code>ftp://<public IP address>/shares</code> to access the USB device over the Internet and download or upload files. <code><public IP address></code> is the external or public IP address that is assigned to the router (for example, 1.1.10.102). The default port is number 21, which you can change. Password protection is enabled by default. If you set up Dynamic DNS, you can also type a URL domain name. For example, if your domain name is MyName and you use the NETGEAR DDNS server, you can type <code>ftp://MyName.mynetgear.com</code> to access the USB device over the Internet and download or upload files.

8. Click the **Apply** button.
Your settings are saved.

Approve a USB storage device

For more security, you can set up the router to share only USB devices that you approve.

To approve USB devices:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > USB Settings**.
The USB Settings page displays.
By default the Enable any USB Device connection to the USB port radio button is selected. This setting lets you connect and access all your USB devices.
5. In the **Enable any USB Device connected to the USB port** section, select the **No** radio button.
6. Click the **Approved Devices** button.
The approved and available USB devices display.
7. In the Available USB Devices list, select the device that you want to approve.
8. Click the **Add** button.
The USB device is added to the Approved USB Devices list.
9. Select the **Allow only approved devices** check box.
10. Click the **Apply** button.
Your settings are saved.
11. To work with another USB storage device, first click the **Safely Remove USB Device** button for the currently connected USB storage device.
Connect the other USB device, and repeat this process.

Enable FTP access within your network

File Transfer Protocol (FTP) lets you download (receive) and upload (send) large files faster.

To enable FTP access within your network:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > USB Functions > ReadySHARE Storage**.
The USB Storage (Advanced Settings) page displays.
5. Select the **FTP** check box.
6. Click the **Apply** button.
Your settings are saved.

View network folders on a storage device

You can view network folders on a storage device that is connected to the router.

To view network folders:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > USB Functions > ReadySHARE Storage**.

The USB Storage (Advanced Settings) page displays.

5. Scroll down to the Available Networks Folder section to view the following settings:
 - **Share Name.** If only one USB device is connected, the default share name is USB_Storage.
You can click the name or you can type it in the address field of your web browser. If Not Shared is shown, the default share was deleted and no other share for the root folder exists.
 - **Read Access and Write Access.** The permissions and access controls on the network folder. All-no password (the default) allows all users to access the network folder. The password for admin is the same one that you use to log in to the router.
 - **Folder Name.** The full path of the network folder.
 - **Volume Name.** The volume name from the storage device.
 - **Total Space and Free Space.** The current utilization of the storage device.

Add a network folder on a USB storage device

You can add network folders on a USB storage device connected to a router USB port.

To add a network folder:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > USB Functions > ReadySHARE Storage**.
The USB Storage (Advanced Settings) page displays.
5. In the Available Network Folders section, select the USB storage device.
If a single device is attached to the USB port, the radio button is selected automatically.

6. Click the **Create Network Folder** button.

The Add Folder window opens.

If this window does not open, your web browser might be blocking pop-ups. If it is, change the browser settings to allow pop-ups.

7. From the **USB Device** menu, select the USB drive.

Note: We recommend that you do not attach more than one drive to one USB port (for example, through a USB hub).

8. Click the **Browse** button and in the Folder field, select the folder.

9. In the **Share Name** field, type the name of the share.

10. From the **Read Access** menu and the **Write Access** menu, select the settings that you want.

All-no password (the default) allows all users to access the network folder. The other option is that only the admin user is allowed access to the network folder. The password for admin is the same one that you use to log in to the router.

11. Click the **Apply** button.

The folder is added on the USB storage device.

12. Click the **Close Window** button.

The window closes.

Edit a network folder on a USB storage device

You can edit network folders on a USB storage devices connected to a router USB port.

To edit a network folder:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > USB Functions > ReadySHARE Storage**.

The USB Storage (Advanced Settings) page displays.

5. In the Available Network Folders section, select the USB storage device.

6. Click the **Edit** button.

The Edit Network Folder window opens.

7. Change the settings in the fields as needed.

8. Click the **Apply** button.

Your settings are saved.

Safely remove a USB storage device

Before you physically disconnect a USB storage device from the router USB port, log in to the router and take the USB storage device offline.

To remove a USB storage device safely:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

A login window opens.

3. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > USB Functions > ReadySHARE Storage**.

The USB Storage (Advanced Settings) page displays.

5. In the Available Network Folders sections, select the USB storage device.

6. Click the **Safely Remove USB Device** button.

This takes the device offline.

7. Physically disconnect the USB storage device.

9

Use Dynamic DNS to Access USB Storage Devices Through the Internet

With Dynamic DNS, you can use the Internet to access a USB device that's connected to a USB port on the router when you're not home.

This chapter contains the following sections:

- [Set up and manage Dynamic DNS](#)
- [Set up FTP access through the Internet](#)
- [Your personal FTP server](#)
- [Access USB storage devices through the Internet](#)
- [Remotely access a USB device using ReadyCLOUD](#)

Set up and manage Dynamic DNS

Internet service providers (ISPs) assign numbers called IP addresses to identify each Internet account. Most ISPs use dynamically assigned IP addresses. This means that the IP address can change at any time. You can use the IP address to access your network remotely, but most people don't know what their IP addresses are or when this number changes.

To make it easier to connect, you can get a free account with a Dynamic DNS service that lets you use a domain name to access your home network. To use this account, you must set up the router to use Dynamic DNS. Then the router notifies the Dynamic DNS service provider whenever its IP address changes. When you access your Dynamic DNS account, the service finds the current IP address of your home network and automatically connects you.

If your ISP assigns a private WAN IP address (such as 192.168.x.x or 10.x.x.x), the Dynamic DNS service does not work because private addresses are not routed on the Internet.

Set up FTP access through the Internet

To set up FTP access through the Internet:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > USB Functions > ReadySHARE Storage**.
The USB Storage (Advanced Settings) page displays.
5. Select the **FTP (via Internet)** check box.
The default port is number 21. Password protection is enabled by default. We recommend that you keep password protection enabled.
6. Click the **Apply** button.
Your settings are saved.

The link that lets you access the device over the Internet is `ftp://public-ip-address/shares`. In this link, *public-ip-address* represents one of the following:

- The IP address that is assigned to the router's Internet port. You can view this IP address on the ADVANCED Home page.
 - If you set up a DDNS account, the router's DNS name, for example, *yourname.mynetgear.com*.
7. To limit read and write access of a device to the admin user, select a device in the Available Network Folder's section.
If only one device is connected, it is automatically selected.
 8. Click the **Edit** button.
The Edit page displays.
 9. From the **Read Access** menu, select **admin**.
 10. From the **Write Access** menu, select **admin**.
 11. Click the **Apply** button.
Your settings are saved.

Your personal FTP server

With your customized free URL, you can use FTP to access your network when you aren't home through Dynamic DNS. To set up your FTP server, you must register for a NETGEAR Dynamic DNS (DDNS) service account and specify the account settings. See [Set up a new Dynamic DNS account](#) on page 145.

Note: The router supports only basic DDNS, and the login and password might not be secure. You can use DDNS with a VPN tunnel for a secure connection.

Set up your personal FTP server

To set up your personal account and use FTP:

1. Get your NETGEAR Dynamic DNS domain name.
For more information, see [Set up a new Dynamic DNS account](#) on page 145.
2. Make sure that your Internet connection is working.
Your router must use a direct Internet connection. It cannot connect to a different router to access the Internet.

3. Connect a storage device to the router.
4. If your USB storage device uses a power supply, connect it.
You must use the power supply when you connect the USB storage device to the router.
When you connect the USB storage device to the router USB port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).
5. Set up FTP access in the router.
See Set up FTP access through the Internet on page 143.
6. On a remote computer with Internet access, you can use FTP to access your router using `ftp://yourname.mynetgear.com`.

Set up a new Dynamic DNS account

To set up Dynamic DNS and register for a free NETGEAR account:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **`http://www.routerlogin.net`**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Dynamic DNS**.
The Dynamic DNS page displays.
5. Select the **Use a Dynamic DNS Service** check box.
6. From the **Service Provider** menu, select **NETGEAR**.
You can select another service provider.
7. Select the **No** radio button.
8. In the **Host Name** field, type the name that you want to use for your URL.
The host name is sometimes called the domain name. Your free URL includes the host name that you specify and ends with `mynetgear.com`. For example, specify `MyName.mynetgear.com`.
9. In the **Email** field, type the email address for your account.

10. In the **Password (6-32 characters)** field, type the password for your account.
11. Click the **Register** button.
12. Follow the onscreen instructions to register for your NETGEAR Dynamic DNS service.

Specify a DNS account that you already created

If you already created a Dynamic DNS account with NETGEAR, No-IP, or DynDNS, you can set up the router to use your account.

To set up Dynamic DNS if you already created an account:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Dynamic DNS**.
The Dynamic DNS page displays.
5. Select the **Use a Dynamic DNS Service** check box.
6. From the **Service Provider** menu, select your provider.
7. Select the **Yes** radio button.
The page adjusts and displays the **Show Status**, **Cancel**, and **Apply** buttons.
8. In the **Host Name** field, type the host name (sometimes called the domain name) for your account.
9. Depending on the type of service, specify either the user name or the email address:
 - **No-IP account or DynDNS account.** In the **User Name** field, type the user name for your account.
 - **NETGEAR account.** In the **Email** field, type the email address for your account.
10. In the **Password (6-32 characters)** field, type the password for your DDNS account.
11. Click the **Apply** button.
Your settings are saved.

12. To verify that your Dynamic DNS service is enabled in the router, click the **Show Status** button.

A message displays the Dynamic DNS status.

Change the Dynamic DNS settings

You can change the settings for your Dynamic DNS account.

To change your settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Dynamic DNS**.
The Dynamic DNS page displays.
5. Change your DDNS account settings as necessary.
6. Click the **Apply** button.
Your settings are saved.

Access USB storage devices through the Internet

You can access USB storage devices through the Internet when you're not home.

To access devices from a remote computer:

1. Launch a web browser on a computer that is not on your home network.
2. Connect to your home router:

The link that lets you access the device over the Internet is <https://public-ip-address/shares>. In this link, *public-ip-address* represents one of the following:

- The IP address that is assigned to the router's Internet port. You can view this IP address on the ADVANCED Home page.
 - If you set up a DDNS account, the router's DNS name, for example, *yourname.mynetwork.com*.
For information about using Dynamic DNS, see [Set up and manage Dynamic DNS](#) on page 143.
3. If password protection is enabled (which it is by default), type your admin password. You can now access your storage devices.

Remotely access a USB device using ReadyCLOUD

NETGEAR ReadyCLOUD for routers lets you remotely access files stored on a USB storage device that is connected to the router. Before you can use ReadyCLOUD, you must create a ReadyCLOUD account and register your router.

A ReadyCLOUD app is also available for Windows computers, Android mobile devices, and iOS mobile devices. For more information about setting up ReadyCLOUD, see the *ReadyCLOUD for Routers User Manual*, which is available online at downloadcenter.netgear.com.

Create a ReadyCLOUD account

To create a ReadyCLOUD account:

1. Launch a web browser from a computer or mobile device.
2. Visit readycloud.netgear.com.
The ReadyCLOUD Welcome page displays.
3. Click the **Sign In** link.
The Sign In page displays.
4. Click the **Create Account** link.
The Create a MyNETGEAR account page displays.
5. Complete the fields to set up your account, and click the **Create** button.

You are now ready to register your router with your ReadyCLOUD account.

Register your router with ReadyCLOUD

After you create a ReadyCLOUD account, you must register your router with your ReadyCLOUD account.

To register your router with your ReadyCLOUD account:

1. Connect a USB storage device to a USB port on the router.
2. If your USB storage device uses a power supply, connect it.
You must use the power supply when you connect the USB storage device to the router.

When you connect the USB storage device to the router's USB port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

3. Launch a web browser from a computer or mobile device that is connected to the router network.
4. Enter **http://www.routerlogin.net**.
A login window opens.
5. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
6. Select **ADVANCED > USB Functions > ReadySHARE Storage > ReadyCLOUD**.
The ReadyCLOUD page displays.
7. Enter your ReadyCLOUD user name and password and click the **Register** button.
If you did not yet create a ReadyCLOUD account, see [Create a ReadyCLOUD account](#) on page 148.
The router is registered with ReadyCLOUD.

Note: If the router's Internet connection mode is set to **Dial on Demand**, the router automatically changes the connection mode to **Always On**. This change is required for ReadyCLOUD to remotely access the USB storage device.

8. After registration, visit readycloud.netgear.com.
9. Click the **Sign In** link, enter your ReadyCLOUD user name and password, and click the **Sign In** button.

The ReadyCLOUD page displays the router that you registered and the contents of the USB storage device that is connected to the router.

10

Use the Router as a Media Server

This chapter contains the following sections:

- [Specify ReadyDLNA Media Server Settings](#)
- [Play Music From a Storage Device With iTunes Server](#)
- [Set Up the Router to Work With TiVo](#)

Specify ReadyDLNA Media Server Settings

By default, the router acts as a ReadyDLNA media server, which lets you view movies and photos on DLNA/UPnP AV-compliant media players, such as Xbox360, Playstation, and NETGEAR media players.

To specify media server settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > USB Functions > ReadySHARE Storage > Media Server**.
The Media Server (Settings) page displays.
5. Specify the settings:
 - **Enable DLNA Media Server**. Select this check box to enable this device to act as a media server.
 - **Enable TiVo support**. Select this check box if you want to play ReadyNAS media on your TiVo device. For more information, see [Set Up the Router to Work With TiVo](#) on page 155.
 - **Enable iTunes Server (Music Only)**. Select this check box if you want to play music from a USB device that is connected to your router with iTunes on your Windows-based or Mac computer using Home Sharing. For more information, see [Set Up the Router's iTunes Server With iTunes](#) on page 153.
 - **Media Server Device Name**. Click the **Edit** button to change the router's media server name.

Note: If you change the media server name, you can also change the ReadySHARE storage folder access path to the new name or keep the access path as `\\readyshare .`
6. Click the **Apply** button.
Your settings are saved.

Play Music From a Storage Device With iTunes Server

iTunes server lets you play music from a USB device that is connected to a USB port on your router with iTunes on your Windows-based or Mac computer or with the Apple Remote app on your iPhone or iPad. You can also use the Apple Remote app from an iPhone or iPad to play music on any AirPlay devices, such as Apple TV or AirPlay-supported receivers.

Supported music file formats are MP3, AAC, and FLAC. The maximum number of music files supported is 10,000.

Set Up the Router's iTunes Server With iTunes

You can play music from a USB device that is connected to your router with iTunes on your Windows or Mac computer using Home Sharing. To set up Home Sharing, you need an Apple account and the latest version of iTunes installed on your computer.

To set up the router's iTunes server to play music on iTunes:

1. Connect a USB storage device to a USB port on your router.
2. If your USB storage device uses a power supply, connect it.
You must use the power supply when you connect the USB storage device to the router.
When you connect the USB storage device to the router's USB port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).
3. Launch a web browser from a computer or mobile device that is connected to the router network.
4. Enter **http://www.routerlogin.net**.
A login window opens.
5. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
6. Select **ADVANCED > USB Functions > ReadySHARE Storage > Media Server**.
The Media Server (Settings) page displays.

7. Select the **Enable iTunes Server (Music Only)** check box.
8. Click the **Apply** button.
Your settings are saved.
9. On your Windows-based or Mac computer, launch iTunes.
10. Select **File > Home Sharing > Turn On Home Sharing**.
The Home Sharing page displays.
11. Enter your Apple ID email address and password.
12. Click the **Turn On Home Sharing** button.
When Home Sharing is enabled, a **Home Sharing** icon  displays in iTunes.
13. Click the **Home Sharing** icon  and from the menu, select the router.
The music that is on the USB device that is connected to the router displays in iTunes.

Set Up the Router's iTunes Server With the Remote App

You can play music from a USB device that is connected to your router on your iPhone or iPad using the Apple Remote app.

To set up the router's iTunes server to play music on your iPhone or iPad:

1. Connect a USB storage device to a USB port on your router.
2. If your USB storage device uses a power supply, connect it.
You must use the power supply when you connect the USB storage device to the router.

When you connect the USB storage device to the router's USB port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).
3. Connect your iPhone or iPad to your router's WiFi network.
4. Download the Remote app from the Apple App Store.
5. Launch the Remote app  from your iPhone or iPad.
6. In the Remote app, click the **Add a Device** button.
The passcode displays in the Remote app.
7. Specify the passcode in the router to set up your iTunes server.
 - a. Launch a web browser from a computer or mobile device that is connected to your router's network.
 - b. Enter **http://www.routerlogin.net**.

A login window opens.

- c. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
- d. Select **ADVANCED > USB Functions > ReadySHARE Storage > Media Server**.
The Media Server (Settings) page displays.
- e. Select the **Enable iTunes Server (Music Only)** check box.
- f. Click the **Apply** button.
- g. Enter the passcode.
- h. Click the **Allow Control** button.
Your settings are saved.
Your iPhone or iPad pairs with the router and the iTunes server is ready. The router displays in the Remote app.

8. In the Remote app, tap the router your iPhone or iPad is connected to.
The music that is on the USB device that is connected to the router displays in the app.

Set Up the Router to Work With TiVo

You can set up your TiVo to access media files stored on a USB device that is connected to your router. The TiVo must be on the same network as the router. This feature supports the following file formats:

- **Video**. See and play `mpeg1`, and `mpeg2` files.
- **Music**. See and play MP3 files.
- **Pictures**. View images in `.jpg` format.

You can use the TiVo (Series 2 and later) Home Media Option to play photos and music on your Windows or Mac computer in your TiVo user interface.

To set up the router to work with TiVo:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **<http://www.routerlogin.net>**.

A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > USB Functions > ReadySHARE Storage > Media Server**.
The Media Server (Settings) page displays.
5. Make sure that the **Enable TiVo support** check box is selected.
6. If you changed the settings, click the **Apply** button.
Your settings are saved.

11

Share a USB Printer

The ReadySHARE Printer utility lets you share a USB printer that is connected to a USB port on your router. You can share this USB printer among the Windows-based and Mac computers on your network.

For more information about the features available in the NETGEAR USB Control Center, see the *ReadySHARE Printer User Manual*, which is available at <http://downloadcenter.netgear.com>.

This chapter contains the following sections:

- [Install the printer driver and cable the printer](#)
- [Download the ReadySHARE printer utility](#)
- [Install the ReadySHARE printer utility](#)
- [Print using the NETGEAR USB Control Center](#)

Install the printer driver and cable the printer

Some USB printer manufacturers (for example, HP and Lexmark) request that you do not connect the USB cable until the installation software prompts you to do so.

To install the driver and cable the printer:

1. On each computer on your network that shares the USB printer, install the driver software for the USB printer.

If you cannot locate the printer driver, contact the printer manufacturer.

2. Use a USB printer cable to connect the USB printer to a router USB port.

Download the ReadySHARE printer utility

The utility works on Windows-based and Mac computers.

To download the utility:

1. Visit <https://www.netgear.com/home/discover/apps/readystatechange>.
2. Click the **PRINT - Learn how you can print wirelessly from many devices** link.
3. Click the **Download PC installer and get started link** to download the ReadySHARE Printer utility setup file to your Windows-based computer.
4. Follow the instructions on the page to download the ReadySHARE Printer utility.

Install the ReadySHARE printer utility

You must install the ReadySHARE Printer utility on each computer that will share the printer. After you install it, the utility displays as NETGEAR USB Control Center on your computer. For more information about how to use the NETGEAR USB Control Center, visit https://www.netgear.com/support/product/ReadySHARE_USB_Printer.aspx.

To install the utility:

1. If necessary, unzip the ReadySHARE Printer utility setup file.
2. Double-click the ReadySHARE Printer utility setup file that you downloaded.
The InstallShield Wizard opens.
3. Follow the prompts to install the NETGEAR USB Control Center.
After the InstallShield Wizard completes the installation, the NETGEAR USB Control Center prompts you to select a language.

4. Select a language from the menu and click the **OK** button.

The NETGEAR USB Control Center opens.

Some firewall software, such as Comodo, blocks the NETGEAR USB Control Center from accessing the USB printer. If you do not see the USB printer displayed on the page, you can disable the firewall temporarily to allow the utility to work.

5. Select the printer and click the **Connect** button.

The printer status changes to Manually connected by *Mycomputer*. Now only the computer that you are using can use this printer.

6. Click the **Disconnect** button.

The status changes to Available. Now all computers on the network can use the printer.

7. To exit the utility, select **System > Exit**.

Print using the NETGEAR USB Control Center

For each computer, after you click the **Connect** and **Disconnect** buttons once, the utility automatically manages the printing queue. By default, the utility starts automatically whenever you log on to Windows and runs in the background.

To print a document using the NETGEAR USB Control Center:

1. Click the **NETGEAR USB Control Center** icon .

The NETGEAR USB Control Center page displays.

2. Select a printer and click the **Connect** button.

The printer status changes to Manually connected by *Mycomputer*. Now only the computer that you are using can use this printer.

3. Use the print feature in your application to print your document.

The NETGEAR USB Control Center automatically connects your computer to the USB printer and prints the document. If another computer is already connected to the printer, your print job goes into a queue to wait to be printed.

4. If your document does not print, use the NETGEAR USB Control Center to check the printer status.

5. To release the printer so that all computers on the network can use it, click the **Disconnect** button.

The status changes to Available. Now any computers on the network can use the printer.

6. To exit the utility, select **System > Exit**.

12

Use OpenVPN to Access Your Network

You can use OpenVPN software to remotely access your router with virtual private networking (VPN). This chapter explains how to install and use OpenVPN software to set up a VPN tunnel.

The chapter contains the following sections:

- [About VPN connections](#)
- [LAN IP addressing in VPN networks](#)
- [Enable OpenVPN service in the router](#)
- [Install OpenVPN software on a VPN client](#)
- [Use VPN to access your Internet service at home](#)
- [Use VPN to remotely access a USB storage device attached to the router](#)

About VPN connections

A virtual private network (VPN) lets you use the Internet to securely access your network when you aren't home.

This type of VPN access is called a client-to-gateway tunnel. The computer is the client, and the router is the gateway. To use the VPN feature, you must do the following:

- Log in to the router to enable and configure OpenVPN (see [Enable OpenVPN service in the router](#) on page 163).
- Install OpenVPN client software and configuration files on your device from which you want to use VPN (see [Install OpenVPN software on a VPN client](#) on page 164).
- Run the OpenVPN client software on your device when you want to use a VPN connection.

Enabling OpenVPN on your router allows VPN connections between the router and a client, for example your laptop when you are away from home. The router provides the VPN service and the laptop is the VPN client. Traffic between the router and the laptop is encrypted.

Note: The router itself does not function as a VPN client to an external VPN service provider, so it does not encrypt traffic passing between your home network and the Internet.

VPN can use either Dynamic DNS (DDNS) or a static IP address to connect with your router:

- To use a DDNS service, register for a DDNS account with a host name. You use the host name to access your network. The router supports these DDNS accounts: NETGEAR, No-IP, and Dyn. For more information, see [Set up and manage Dynamic DNS](#) on page 143.
- If your Internet service provider (ISP) assigned a static WAN IP address that never changes, the VPN can use that IP address to connect to your home network.

LAN IP addressing in VPN networks

For the VPN connection to work, your computer or device (the VPN client) must be connected to a network that uses a different LAN IP address scheme than your router.

The default LAN IP address scheme for the router is 192.168.1.x. (The most common IP schemes are 192.168.x.x, 172.x.x.x, and 10.x.x.x.) If you experience a conflict, change the IP scheme either for your home network or for the network where your VPN client device is connected.

If both networks use the same LAN IP scheme, when the VPN tunnel is established, you cannot access your home router or your home network with the OpenVPN software.

For information about changing the LAN settings on the router, see [Change the LAN TCP/IP settings](#) on page 59.

Enable OpenVPN service in the router

You must enable the OpenVPN service settings in the router before you can use a VPN connection.

To enable OpenVPN service:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VPN Service**.
The VPN page displays.

Note: The OpenVPN configuration software packages that you can download on the page are for the VPN client devices (see [Install OpenVPN software on a VPN client](#) on page 164).

5. Select the **Enable VPN Service** check box.
We recommend that you use the default TUN mode and TAP mode settings. (These settings determine how VPN information is transferred.) If you know that you need other settings, you can change the TUN mode and TAP mode settings, but you must do so *before* you download and install the OpenVPN configuration software packages on client devices (see [Install OpenVPN software on a VPN client](#) on page 164).
6. To change the TUN mode settings, do the following:
 - To change the TUN mode service type, select the **UDP** or **TCP** radio button. The default protocol for TUN mode is UDP.
 - To change the TUN mode service port, type the port number that you want to use in the field.

The default port number for TUN mode is 12973. The TUN port number is used in the `.ovpn` file of the OpenVPN configuration software package for Mac and non-Windows clients.

7. To change the TAP mode settings, do the following:

- To change the TAP mode service type, select the **UDP** or **TCP** radio button. The default protocol for TAP mode is UDP.
- To change the TAP mode service port, type the port number that you want to use in the field. The default port number for TAP mode is 12974. The TAP port number is used in the `.ovpn` file of the OpenVPN configuration software package for Windows clients.

8. Click the **Apply** button.

Your changes are saved. VPN is enabled in the router, but you must install and set up OpenVPN software on your device before you can use a VPN connection.

Install OpenVPN software on a VPN client

You must install OpenVPN software on each Windows-based computer, Mac computer, iOS device, and Android device that you plan to use for VPN connections to your router. Each computer or device is called a VPN client.

The software consists of the application software and the configuration files:

- Download and install the application software from the link that is provided in each client-specific section.
- Download and install the configuration files from the router as described in each client-specific section. The configuration files provide the correct router configuration information for the client utility. You must download the configuration files *after* you enable and configure OpenVPN service in the router (see [Enable OpenVPN service in the router](#) on page 163).

Note: If you later change the OpenVPN configuration in the router (for example, you change the TUN or TAP port number), you must download and install the `.ovpn` configuration file again on each client, depending on its operating system. If you change the TUN port number in the router, the `.ovpn` configuration file for Mac and non-Windows clients changes. If you change the TAP port number in the router, the `.ovpn` configuration file for Windows clients changes.

Install OpenVPN software on a Windows-based computer

You must install both the OpenVPN client utility and OpenVPN configuration files on each Windows-based computer where you want to use a VPN connection to your router.

To download and install the OpenVPN client utility and OpenVPN configuration files on a Windows-based computer:

1. To download the OpenVPN client utility on your Windows-based computer, visit openvpn.net/community-downloads/.
2. Select the Windows package with the installer files.
In most situations, you can download the Windows 32-bit or Windows 64-bit installer files, depending on your Windows operating system.
3. Download and install the OpenVPN client utility on your computer.
You need to have administrative privileges.
4. Launch a web browser from the computer, which must be connected to the router network.
5. Enter **http://www.routerlogin.net**.
A login window opens.
6. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
7. Select **ADVANCED > Advanced Setup > VPN Service**.
The VPN Service page displays.
8. Make sure that the **Enable VPN Service** check box is selected.
For more information about the VPN configuration for the router, see [Enable OpenVPN service in the router](#) on page 163.
9. Click the **For Windows** button to download the router's OpenVPN configuration files to your Windows-based computer.
10. Unzip the OpenVPN configuration files and copy them to the folder in which you installed the OpenVPN client utility.

11. Modify the VPN interface name to **NETGEAR-VPN**:
 - a. If your computer is running Windows 10, select **Control Panel > Network and Sharing Center > Change adapter settings**.
If your computer is running another Windows version, find the page that lets you change the adapter settings.
 - b. In the local area connection list, find the local area connection with the device name **TAP-Windows Adapter**.
 - c. Select the local area connection and change its name (*not* its device name) to **NETGEAR-VPN**.
If you do not change the VPN interface name, the VPN tunnel connection will fail.

You can now open a VPN tunnel to the router.

For more information about installing and using OpenVPN on your Windows-based computer, visit <https://openvpn.net/community-resources/how-to/#quick>.

Install OpenVPN software on a Mac computer

You must install both the Tunnelblick OpenVPN client utility and OpenVPN configuration files on each Mac computer where you want to use a VPN connection to your router.

To download and install the Tunnelblick OpenVPN client utility and OpenVPN configuration files on a Mac computer:

1. To download the Tunnelblick OpenVPN client utility on your Mac computer, visit <https://tunnelblick.net/downloads.html>.
2. Download and install the Tunnelblick OpenVPN client utility on your Mac computer. You need to have administrative privileges.
3. Launch a web browser from the Mac computer, which must be connected to the router network.
4. Enter **http://www.routerlogin.net**.
A login window opens.
5. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
6. Select **ADVANCED > Advanced Setup > VPN Service**.
The VPN Service page displays.

7. Make sure that the **Enable VPN Service** check box is selected.
For more information about the VPN configuration for the router, see [Enable OpenVPN service in the router](#) on page 163.
8. Click the **For non-Windows** button to download the router's OpenVPN configuration files to your Mac computer.
9. Unzip the OpenVPN configuration files and copy them to the folder in which you installed the Tunnelblick OpenVPN client utility.

You can now open a VPN tunnel to the router.

For more information about installing and using OpenVPN on your Mac computer, visit <https://openvpn.net/vpn-server-resources/installation-guide-for-openvpn-connect-client-on-macos/>.

Install OpenVPN software on an iOS device

You must install both the OpenVPN Connect app and OpenVPN configuration files on each iOS device where you want to use a VPN connection to your router.

To download and install the OpenVPN Connect app and OpenVPN configuration files on an iOS device:

1. On your iOS device, download and install the OpenVPN Connect app from the Apple app store.
2. Launch a web browser from a computer or your iOS device that is connected to the router network.
3. Enter **http://www.routerlogin.net**.
A login window opens.
4. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
5. Select **ADVANCED > Advanced Setup > VPN Service**.
The VPN Service page displays.
6. Make sure that the **Enable VPN Service** check box is selected.
For more information about the VPN configuration for the router, see [Enable OpenVPN service in the router](#) on page 163.
7. Click the **For Smart Phone** button to download the router's OpenVPN configuration files to your computer or iOS device.

If you download the configuration files to your computer, unzip the files, and send them your iOS device.

8. On your iOS device, do the following:
 - a. Open the `.ovpn` file.
 - b. If the OpenVPN Connect app does not start automatically, a list of apps might display: Select the OpenVPN Connect app.
 - c. Install the `.ovpn` file.

You can now open a VPN tunnel to the router.

For more information about installing and using OpenVPN on your iOS device, visit https://www.vpngate.net/en/howto_openvpn.aspx#ios.

Install OpenVPN software on an Android device

You must install both the OpenVPN Connect app and OpenVPN configuration files on each Android device where you want to use a VPN connection to your router.

To download and install the OpenVPN Connect app and OpenVPN configuration files on an Android device:

1. On your Android device, download and install the OpenVPN Connect app from the Google Play Store.
2. Launch a web browser from a computer or your Android device that is connected to the router network.
3. Enter **<http://www.routerlogin.net>**.
A login window opens.
4. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
5. Select **ADVANCED > Advanced Setup > VPN Service**.
The VPN Service page displays.
6. Make sure that the **Enable VPN Service** check box is selected.
For more information about the VPN configuration for the router, see [Enable OpenVPN service in the router](#) on page 163.
7. Click the **For Smart Phone** button to download the router's OpenVPN configuration files to your computer or Android device.

If you download the configuration files to your computer, unzip the files, and send them your Android device.

8. On your Android device, open the `.ovpn` file and import it into the OpenVPN Connect app.

You can now open a VPN tunnel to the router.

For more information about using OpenVPN on your Android device, visit https://www.vpngate.net/en/howto_openvpn.aspx#android.

Use VPN to access your Internet service at home

When you're away from home and you access the Internet, you usually use a local Internet service provider. For example, at a coffee shop you might be given a code that lets you use the coffee shop's Internet service account to surf the web.

Your router lets you use a VPN connection to access your own Internet service when you're away from home. You might want to do this if you travel to a geographic location that doesn't support all the Internet services that you use at home. For example, your Netflix account might work at home but not in a different country.

Allow VPN client Internet access in the router

By default, the router is set up to allow VPN connections only to your home network, but you can change the settings to allow Internet access. Accessing the Internet remotely through a VPN might be slower than accessing the Internet directly.

To allow VPN clients to use your home Internet service:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **<http://www.routerlogin.net>**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VPN Service**.
The VPN Service page displays.

5. Make sure that the **Enable VPN Service** check box is selected.
For more information about the VPN configuration for the router, see [Enable OpenVPN service in the router](#) on page 163.
6. Scroll down to the Clients will use this VPN connection to access section, and select the **All sites on the Internet & Home Network** radio button.
When you access the Internet with the VPN connection, instead of using a local Internet service, you use the Internet service from your home network.
7. Click the **Apply** button.
Your settings are saved.

Block VPN client Internet access in the router

By default, the router is set up to allow VPN connections only to your home network, not to the Internet service for your home network. If you changed this setting to allow Internet access, you can change it back.

To allow VPN clients to access only your home network and block them from using the Internet service for your home network:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VPN Service**.
The VPN Service page displays.
5. Make sure that the **Enable VPN Service** check box is selected.
For more information about the VPN configuration for the router, see [Enable OpenVPN service in the router](#) on page 163.
6. Scroll down to the Clients will use this VPN connection to access section, and select the **Home Network only** radio button.
This is the default setting. The VPN connection is only to your home network, not to the Internet service for your home network.

7. Click the **Apply** button.
Your settings are saved.

Use VPN to remotely access a USB storage device attached to the router

If you attach a USB storage device to a USB port on your router, after you make a VPN connection from a remote VPN client device to your home router, you can access the USB storage device. Because the router supports ReadySHARE, the USB storage device might display as a ReadySHARE network device on your home router's local LAN.

Note: On the remote VPN client, your home router might display as the remote router.

13

Manage port forwarding and port triggering

You can use port forwarding and port triggering to set up rules for Internet traffic. You need networking knowledge to set up these features.

This chapter contains the following sections:

- [Manage port forwarding to a local server](#)
- [Port triggering](#)

Manage port forwarding to a local server

If your home network includes a server, you can allow certain types of incoming traffic to reach the server. For example, you might want to make a local web server, FTP server, or game server visible and available to the Internet.

The router can forward incoming traffic with specific protocols to computers on your local network. You can specify the servers for applications and you can also specify a default DMZ server to which the router forwards all other incoming protocols.

Set up port forwarding to a local server

To forward specific incoming protocols:

1. Decide which type of service, application, or game you want to provide.
2. Find the local IP address of the computer on your network that will provide the service.
The server computer must always use the same IP address.
3. Assign the server computer a reserved IP address.
See [Manage reserved LAN IP addresses](#) on page 63.
4. Launch a web browser from a computer or mobile device that is connected to the router network.
5. Enter **http://www.routerlogin.net**.
A login window opens.
6. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
7. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
The Port Forwarding / Port Triggering page displays.
8. Leave the **Port Forwarding** radio button selected as the service type.
9. From the **Service Name** menu, select the service name.
If the service that you want to add is not in the menu, create a custom service. See [Add a custom port forwarding service](#) on page 174.
10. In the **Server IP Address** field, enter the IP address of the computer that will provide the service.

11. Click the **Add** button.

The service displays in the menu.

Add a custom port forwarding service

The router lists default services and applications that you can use in port forwarding rules. If the service or application is not predefined, you can add a port forwarding rule with a custom service or application.

To add a custom service:

1. Find out which port number or range of numbers the application uses.
You can usually find this information by contacting the publisher of the application or user groups or news groups.
2. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter **http://www.routerlogin.net**.
A login window opens.
4. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
5. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
The Port Forwarding / Port Triggering page displays.
6. Leave the **Port Forwarding** radio button selected as the service type.
7. Click the **Add Custom Service** button.
The Ports - Custom Service page displays.
8. In the **Service Name** field, enter a descriptive name.
9. From the **Protocol** menu, select the protocol.
If you are unsure, select **TCP/UDP**.
10. In the **External port range** field enter the port range.
11. Specify the internal ports by one of these methods:
 - Leave the **Use the same port range for Internal port** check box selected.
 - Type the port numbers in the **Internal Starting Port** field and the **Internal Ending Port** field.

You can enter a port range and fixed ports in one rule, for example, external (30-50, 78, 100-102), internal (40-60, 99, 200-202). With this rule, external ports 30-50 are forwarded to internal ports 40-60.

12. In the **Internal IP address** field, type the IP address or select the radio button for an attached device listed in the table.
13. Click the **Apply** button.
The service is now in the list on the Port Forwarding/Port Triggering page.

Edit a port forwarding service

To edit a port forwarding entry:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
The Port Forwarding / Port Triggering page displays.
5. Leave the **Port Forwarding** radio button selected as the service type.
6. In the table, select the radio button next to the service name.
7. Click the **Edit Service** button.
The Ports - Custom Services page displays.
8. Change the settings as needed.
9. Click the **Apply** button.
Your settings are saved.

Delete a port forwarding entry

To delete a port forwarding entry:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
The Port Forwarding / Port Triggering page displays.
5. Leave the **Port Forwarding** radio button selected.
6. In the table, select the radio button next to the service name.
7. Click the **Delete Service** button.
The service is deleted.

Application example: Make a local web server public

If you host a web server on your local network, you can use port forwarding to allow web requests from anyone on the Internet to reach your web server.

To make a local web server public:

1. Assign your web server either a fixed IP address or a dynamic IP address using DHCP address reservation.
In this example, your router always gives your web server an IP address of 192.168.1.33.
2. On the Port Forwarding/Port Triggering page, configure the router to forward the HTTP service to the local address of your web server at 192.168.1.33.
HTTP (port 80) is the standard protocol for web servers.
3. (Optional) Register a host name with a Dynamic DNS service and specify that name on the Dynamic DNS page of the router.
Dynamic DNS makes it much easier to access a server from the Internet because you can type the name in the Internet browser. Otherwise, you must know the IP address that the ISP assigned, which typically changes.

How the router implements the port forwarding rule

The following sequence shows the effects of a port forwarding rule:

1. When you type the URL `www.example.com` in your browser, the browser sends a web page request message with the following destination information:
 - **Destination address.** The IP address of `www.example.com`, which is the address of your router.
 - **Destination port number.** 80, which is the standard port number for a web server process.
2. Your router receives the message and finds your port forwarding rule for incoming port 80 traffic.
3. The router changes the destination in the message to IP address 192.168.1.33 and sends the message to that computer.
4. Your web server at IP address 192.168.1.33 receives the request and sends a reply message to your router.
5. Your router performs Network Address Translation (NAT) on the source IP address and sends the reply through the Internet to the computer or WiFi device that sent the web page request.

Port triggering

Port triggering is a dynamic extension of port forwarding that is useful in these cases:

- An application must use port forwarding to more than one local computer (but not simultaneously).
- An application must open incoming ports that are different from the outgoing port.

With port triggering, the router monitors traffic to the Internet from an outbound “trigger” port that you specify. For outbound traffic from that port, the router saves the IP address of the computer that sent the traffic. The router temporarily opens the incoming port or ports that you specify in your rule and forwards that incoming traffic to that destination.

Port forwarding creates a static mapping of a port number or range of ports to a single local computer. Port triggering can dynamically open ports to any computer when needed and close the ports when they are no longer needed.

Note: If you use applications such as multiplayer gaming, peer-to-peer connections, real-time communications such as instant messaging, or remote assistance, enable Universal Plug and Play (UPnP).

Add a port triggering service

To add a port triggering service:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
The Port Forwarding / Port Triggering page displays.
5. Select the **Port Triggering** radio button.
The page adjusts.
6. Click the **Add Service** button.
The Port Triggering - Services page displays.
7. In the **Service Name** field, type a descriptive service name.
8. From the **Service User** menu, select a user option:
 - **Any**: This is the default setting and allows any computer on the Internet to use this service.
 - **Single address**: Restricts the service to a particular computer. Enter the IP address in the fields, which become available with this selection from the menu.
9. From the **Service Type** menu, select the protocol (**TCP** or **UDP**) that is associated with the service or application.
10. In the **Triggering Port** field, enter the number of the outbound traffic port that must open the inbound ports.
11. From the **Connection Type** menu, select the protocol (**TCP** or **UDP**) that is associated with the inbound connection.
If you are unsure, select **TCP/UDP**.
12. In the **Starting Port** and **Ending Port** fields, enter the enter the numbers of the inbound traffic ports.
13. Click the **Apply** button.

The service is now in the Portmap Table. You must enable port triggering before the router uses port triggering. See [Enable port triggering](#) on page 179.

Enable port triggering

To enable port triggering:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
The Port Forwarding/Port Triggering page displays.
5. Select the **Port Triggering** radio button.
The page adjusts.
6. Clear the **Disable Port Triggering** check box.
If this check box is selected, the router does not use port triggering even if you specified port triggering settings.
7. In the **Port Triggering Timeout** field, enter a value up to 9999 minutes.
This value controls how long the inbound ports stay open when the router detects no activity. This value is required because the router cannot detect when the application terminates.
8. Click the **Apply** button.
Your settings are saved.

Application example: Port triggering for Internet relay chat

Some application servers, such as FTP and IRC servers, send replies to multiple port numbers. Using port triggering, you can tell the router to open more incoming ports when a particular outgoing port starts a session.

An example is Internet Relay Chat (IRC). Your computer connects to an IRC server at destination port 6667. The IRC server not only responds to your originating source port

but also sends an “identify” message to your computer on port 113. Using port triggering, you can tell the router, “When you initiate a session with destination port 6667, you must also allow incoming traffic on port 113 to reach the originating computer.” The following sequence shows the effects of this port triggering rule:

1. You open an IRC client program to start a chat session on your computer.
2. Your IRC client composes a request message to an IRC server using a destination port number of 6667, the standard port number for an IRC server process. Your computer then sends this request message to your router.
3. Your router creates an entry in its internal session table describing this communication session between your computer and the IRC server. Your router stores the original information, performs Network Address Translation (NAT) on the source address and port, and sends this request message through the Internet to the IRC server.
4. Noting your port triggering rule and observing the destination port number of 6667, your router creates another session entry to send any incoming port 113 traffic to your computer.
5. The IRC server sends a return message to your router using the NAT-assigned source port (for example, port 33333) as the destination port and sends an “identify” message to your router with destination port 113.
6. When your router receives the incoming message to destination port 33333, it checks its session table to see if a session is active for port number 33333. Finding an active session, the router restores the original address information replaced by NAT and sends this reply message to your computer.
7. When your router receives the incoming message to destination port 113, it checks its session table and finds an active session for port 113 associated with your computer. The router replaces the message’s destination IP address with your computer’s IP address and forwards the message to your computer.
8. When you finish your chat session, your router eventually senses a period of inactivity in the communications. The router then removes the session information from its session table and incoming traffic is no longer accepted on port numbers 33333 or 113.

14

Troubleshooting

This chapter provides information to help you diagnose and solve problems you might experience with your router. If you do not find the solution here, check the NETGEAR support site at netgear.com/support for product and contact information.

The chapter contains the following sections:

- [Quick tips](#)
- [Troubleshoot with the LEDs](#)
- [You cannot log in to the router](#)
- [You cannot access the Internet](#)
- [Troubleshoot Internet browsing](#)
- [Changes are not saved](#)
- [Troubleshoot WiFi connectivity](#)
- [Troubleshoot your network using the ping utility](#)

Quick tips

This section describes tips for troubleshooting some common problems.

Sequence to restart your network

If you must restart your network, follow this sequence:

1. Turn off and unplug the modem.
2. Turn off the router.
3. Plug in the modem and turn it on. Wait two minutes.
4. Turn on the router and wait two minutes.

Check the power adapter and Ethernet cable connections

If the router does not start, make sure that the power adapter cable is securely plugged in.

If the Internet connection or LAN connections do not function, make sure that the Ethernet cables are securely plugged in. The Internet LED on the router is lit if the Ethernet cable connecting the router and the modem is plugged in securely and the modem and router are turned on. If one or more powered-on computers are connected to the router by an Ethernet cable, the corresponding numbered router LAN port LEDs light.

Check the WiFi settings

Make sure that the WiFi settings on the WiFi-enabled computer or mobile device and the router match exactly. The WiFi network name (SSID) and WiFi security settings of the router and the computer or mobile device must match exactly. WiFi passwords are case sensitive.

If you set up an access control list, you must add the MAC address of each computer and mobile device to the router's access control list.

Check the network settings

If your computer or mobile device cannot connect to the router, make sure that the network settings of the computer or mobile device are correct. Computers and mobile devices must use network IP addresses on the same network as the router. By default, almost all computers and mobile devices are set up to obtain an IP address automatically using DHCP.

Some Internet service providers require you to use the MAC address of the computer initially registered on the account, but this is an unusual situation. You can view the MAC address on the Attached Devices page of the router web interface.

Troubleshoot with the LEDs

By default, the router uses standard LED settings.

Standard LED behavior when the router is powered on

After you turn on power to the router, verify that the following sequence of events occurs:

1. When power is first applied, verify that the Power LED is lit.
2. After about two minutes, verify the following:
 - The Power LED is lit.
 - The Internet LED is lit.
 - The WiFi LED is lit (unless you turned off the WiFi radio).

You can use the LEDs on the front panel of the router for troubleshooting.

Power LED is off or blinking

This could occur for a number of reasons. Check the following:

- Make sure that the power adapter is securely connected to your router and securely connected to a working power outlet.
- Make sure that you are using the power adapter that NETGEAR supplied for this product.
- If the Power LED blinks slowly and continuously, the router firmware is corrupted. This can happen if a firmware update is interrupted, or if the router detects a problem with the firmware. If the error persists, it is likely that a hardware problem exists. For recovery instructions, or help with a hardware problem, contact Technical Support at netgear.com/support.

LEDs never turn off

When the router is turned on, the LEDs light for about 10 seconds and then turn off. If all the LEDs stay on, this indicates a fault within the router.

If all LEDs are still lit one minute after power-up, do the following:

- Cycle the power to see if the router recovers.
- Press and hold the **Reset** button to return the router to its factory settings.

If the error persists, a hardware problem might be the cause. Contact Technical Support at netgear.com/support.

Internet or Ethernet LAN port LEDs are off

If the Internet LED or Ethernet LAN port LEDs do not light when an Ethernet connection is made, check the following:

- Make sure that the Ethernet cable connections are secure at the router and at the modem or computer.
- Make sure that power is turned on to the connected modem or computer.
- Be sure that you are using the correct cable.

When you connect the router's Internet port to a modem, use the cable that was supplied with the modem. This cable can be a standard straight-through Ethernet cable or an Ethernet crossover cable.

WiFi LED is off

If the WiFi LED stays off, check to see if someone pressed the **WiFi On/Off** button on the router. This button turns the WiFi radios in the router on and off. If someone disabled the WiFi radios by using the router web interface, the WiFi LED also stays off. The WiFi LED is lit when the WiFi radios are turned on.

You cannot log in to the router

If you are unable to log in to the router from a computer or mobile device on your local network, check the following:

- If you are using an Ethernet-connected computer, check the cable connection between the computer and the router.
- If you are using a WiFi-enabled computer or mobile device, check the WiFi connection between the computer or mobile device and the router.
- Make sure that you are using the correct login information. The user name is **admin**. The password is the one that you specified the first time that you logged in. (The default password is **password**.) The user name and password are case-sensitive. Make sure that Caps Lock is off when you enter this information.

- Try quitting the browser and launching it again.
- Make sure that Java, JavaScript, or ActiveX is enabled in your browser. If you are using Internet Explorer, click the **Refresh** button to be sure that the Java applet is loaded.
- Make sure that the IP address of your computer or mobile device is in the same subnet as the router. If you are using the recommended addressing scheme, the IP address of your computer or mobile device is in the range of 192.168.1.2 to 192.168.1.254.
- If the IP address of your computer or mobile device is shown as 169.254.x.x, the computer or mobile device could not reach the router's DHCP server and the Windows or Mac operating system generated and assigned an IP address. Such an autogenerated IP address is in the range of 169.254.x.x. If your IP address is in this range, check the connection from the computer or mobile device to the router, and reboot your computer or mobile device.
- If your router's IP address was changed and you do not know the current IP address, clear the router's configuration to factory defaults. This sets the router's IP address to 192.168.1.1.

Note: If the router is in access point mode or bridge mode and you do not know the IP address that is assigned to it, first try to use an IP scanner application to detect the IP address. (IP scanner applications are available online free of charge.) If you can detect the IP address, you don't need to reset the router to factory default settings.

- If you are attempting to set up your NETGEAR router as a replacement for an ADSL gateway in your network, the router cannot perform many gateway services. For example, the router cannot convert ADSL or cable data into Ethernet networking information. NETGEAR does not support such a configuration.

You cannot access the Internet

If you can access your router but not the Internet, check to see if the router can obtain a WAN IP address from your Internet service provider (ISP). Unless your ISP provides a fixed IP address, your router requests an IP address from the ISP. You can determine whether the request was successful using the router web interface.

To check the WAN IP address:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Select an external site such as <https://www.netgear.com/>.

3. Enter **http://www.routerlogin.net**.

A login window opens.

4. Enter the router admin user name and password.

The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

5. Click the **ADVANCED** tab.

The ADVANCED Home page displays.

6. Check to see that an IP address is shown for the Internet port. If 0.0.0.0 is shown, your router did not obtain an IP address from your ISP.

If your router cannot obtain an IP address from the ISP, you might need to force your modem to recognize your new router by restarting your network. For more information, see [Sequence to restart your network](#) on page 182.

If your router is still unable to obtain an IP address from the ISP, the problem might be one of the following:

- Your Internet service provider (ISP) might require a login program. Ask your ISP whether they require PPP over Ethernet (PPPoE) or some other type of login.
- If your ISP requires a login, the login name and password might be set incorrectly.
- Your ISP might check for your computer's host name. Assign the computer host name of your ISP account as the account name on the Internet Setup page.
- If your ISP allows only one Ethernet MAC address to connect to Internet and checks for your computer's MAC address, do one of the following:
 - Inform your ISP that you bought a new network device and ask them to use the router's MAC address.
 - Configure your router to clone your computer's MAC address.

If your router obtained an IP address, but your computer does not load any web pages from the Internet, it might be for one or more of the following reasons:

- Your computer might not recognize any DNS server addresses. Typically, your ISP provides the addresses of one or two DNS servers for your use. If you entered a DNS address during the router's configuration, reboot your computer, and verify the DNS address. You can configure your computer manually with DNS addresses, as explained in your operating system documentation.
- The router might not be configured as the TCP/IP gateway on your computer.

If your computer obtains its information from the router by DHCP, reboot the computer and verify the gateway address.

- You might be running login software that is no longer needed. If your ISP provided a program to log you in to the Internet, you no longer need to run that software after installing your router.

Troubleshoot Internet browsing

If your router can obtain an IP address but your computer is unable to load any web pages from the Internet, it might be for the following reasons:

- The traffic meter is enabled, and the limit was reached. By configuring the traffic meter not to block Internet access when the traffic limit is reached, you can resume Internet access. If your Internet service provider (ISP) sets a usage limit, they might charge you for the overage.
- Your computer might not recognize any DNS server addresses. A DNS server is a host on the Internet that translates Internet names (such as www addresses) to numeric IP addresses. Typically, your ISP provides the addresses of one or two DNS servers for your use. If you entered a DNS address during the router's configuration, restart your computer. Alternatively, you can configure your computer manually with a DNS address, as explained in the documentation for your computer.
- The router might not be configured as the default gateway on your computer. Restart the computer and verify that the router address (www.routerlogin.net) is listed by your computer as the default gateway address.

Changes are not saved

If the router does not save the changes that you make in the router web interface, do the following:

- When entering configuration settings, always click the **Apply** button before moving to another page or tab, or your changes are lost.
- Click the **Refresh** or **Reload** button in the web browser. It is possible that the changes occurred, but the old settings might be in the web browser's cache.

Troubleshoot WiFi connectivity

If you are experiencing trouble connecting over WiFi to the router, try to isolate the problem:

- Does the WiFi device or computer that you are using find your WiFi network? If not, check the WiFi LED on the router. If it is off, you can press the **WiFi On/Off** button on the router to turn the router WiFi radios back on. If you disabled the router's SSID broadcast, then your WiFi network is hidden and does not display in your WiFi client's scanning list. (By default, SSID broadcast is enabled.)
- Does your WiFi device support the security that you are using for your WiFi network (WPA, WPA2, or WPA3)?
- If you want to view the WiFi settings for the router, use an Ethernet cable to connect a computer to a LAN port on the router. Then log in to the router, and select **BASIC > Wireless**.

Note: Be sure to click the **Apply** button if you change settings.

If your WiFi device finds your network but the signal strength is weak, check these conditions:

- Is your router too far from your computer or too close? Place your computer near the router but at least 6 feet (1.8 meters) away and see whether the signal strength improves.
- Are objects between the router and your computer blocking the WiFi signal?

Troubleshoot your network using the ping utility

Most network devices and routers contain a ping utility that sends an echo request packet to the designated device. The device then responds with an echo reply. You can easily troubleshoot a network using the ping utility in your computer or workstation.

Test the LAN path to your router

You can ping the router from your computer to verify that the LAN path to your router is set up correctly.

To ping the router from a Windows-based computer:

1. From the Windows toolbar, click the **Start** button and select **Run**.
2. In the field provided, type **ping** followed by the IP address of the router, as in this example:

ping www.routerlogin.net

3. Click the **OK** button.

You see a message like this one:

```
Pinging <IP address > with 32 bytes of data
```

If the path is working, you see this message:

```
Reply from < IP address >: bytes=32 time=NN ms TTL=xxx
```

If the path is not working, you see this message:

```
Request timed out
```

If the path is not functioning correctly, one of the following problems might be occurring:

- Wrong physical connections
For a wired connection, make sure that the numbered LAN port LED is lit for the port to which you are connected.
Check to see that the appropriate LEDs are lit for your network devices. If your router and computer are connected to a separate Ethernet switch, make sure that the link LEDs are lit for the switch ports that are connected to your computer and router.
- Wrong network configuration
Verify that the Ethernet card driver software and TCP/IP software are both installed and configured on your computer.
Verify that the IP address for your router and your computer are correct and that the addresses are on the same subnet.

Test the path from a Windows-based computer to a remote device

To test the path from a Windows-based computer to a remote device:

1. From the Windows toolbar, click the **Start** button and select **Run**.
2. In the Windows Run window, type

ping -n 10 <IP address>

where <IP address> is the IP address of a remote device such as your ISP DNS server.

If the path is functioning correctly, messages display that are similar to those shown in [Test the LAN path to your router](#) on page 188.

3. If you do not receive replies, check the following:
- Check to see that IP address of your router is listed as the default gateway for your computer. If DHCP assigns the IP configuration of your computers, this information is not visible in your computer Network Control Panel. Verify that the IP address of the router is listed as the default gateway.
 - Check to see that the network address of your computer (the portion of the IP address specified by the subnet mask) is different from the network address of the remote device.
 - Check to see that your cable or DSL modem is connected and functioning.
 - If your ISP assigned a host name to your computer, enter that host name as the account name on the Internet Setup page.
 - Your ISP might be rejecting the Ethernet MAC addresses of all but one of your computers.

Many broadband ISPs restrict access by allowing traffic only from the MAC address of your broadband modem. Some ISPs additionally restrict access to the MAC address of a single computer connected to that modem. If your ISP does this, configure your router to "clone" or "spoof" the MAC address from the authorized computer.

A

Supplemental Information

This chapter includes technical information about your router.

The chapter covers the following topics:

- [Factory Settings](#)
- [Technical Specifications](#)

Factory Settings

You can return the router to its factory settings. Use the end of a paper clip or a similar object to press and hold the **Reset** button on the back of the router for at least seven seconds. The router resets and returns to the factory configuration settings shown in the following table.

Table 2. Factory default settings

Feature		Default setting
Router login	User login URL	www.routerlogin.com or www.routerlogin.net
	User name (case-sensitive)	admin
	Login password (case-sensitive)	password
Internet connection	WAN MAC address	Use default hardware address
	WAN MTU size	1500
	Port speed	AutoSensing
Local network (LAN)	LAN IP	192.168.1.1
	Subnet mask	255.255.255.0
	DHCP server	Enabled
	DHCP range	192.168.1.2 to 192.168.1.254
	DHCP starting IP address	192.168.1.2
	DHCP ending IP address	192.168.1.254
	DMZ	Disabled
	Time zone	GMT for WW except NA and GR, GMT+1 for GR, GMT-8 for NA
	Time adjusted for daylight saving time	Disabled
Firewall	SNMP	Disabled
	Inbound (communications coming in from the Internet)	Disabled (except traffic on port 80, the HTTP port)
	Outbound (communications going out to the Internet)	Enabled (all)
	Source MAC filtering	Disabled

Table 2. Factory default settings (Continued)

Feature	Default setting	
Wireless	Wireless communication	Enabled
	SSID name	See router label
	Security	WPA2-PSK (AES)
	Broadcast SSID	Enabled
	Transmission speed	Auto Note: Maximum wireless signal rate derived from IEEE Standard 802.11 specifications. Actual throughput can vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, and network overhead, lower actual data throughput rate.
	Country/region	United States in the US; otherwise, varies by region
	RF channel	6 until region selected
	Operating mode	Up to 450 Mbps at 2.4 GHz, 1300 Mbps at 5 GHz

Technical Specifications

Table 3. Router specifications

Feature	Description
Data and routing protocols	TCP/IP, RIP-1, RIP-2, DHCP, PPPoE, PPTP, Bigpond, Dynamic DNS, UPnP, and SMB
Power adapter	<ul style="list-style-type: none"> • North America: 120V, 60 Hz, input • UK, Australia: 240V, 50 Hz, input • Europe: 230V, 50 Hz, input • All regions (output): 12V/2.5A-DC output
Dimensions	7.5 x 7.79 x 2.55 in. (191 x 198.5 x 65 mm)
Weight	0.94 lb (430 g)
Operating temperature	0° to 40°C (32° to 104°F)
Operating humidity	90% maximum relative humidity, noncondensing

Nighthawk AC1750 Smart WiFi Router

Table 3. Router specifications (Continued)

Feature	Description
Electromagnetic emissions	FCC Part 15 Class B EN 55022 (CISPR 22), Class B C-Tick N10947
LAN	Four RJ-45 ports that support 10BASE-T, 100BASE-TX, and 1000BASE-T
WAN	One RJ-45 port that supports 10BASE-T, 100BASE-TX, and 1000BASE-T
Wireless	Maximum wireless signal rate complies with the IEEE 802.11 standard. Note: Maximum wireless signal rate derived from IEEE Standard 802.11 specifications. Actual throughput can vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, and network overhead, lower actual data throughput rate.
Radio data rates	Auto Rate Sensing
Data encoding standards	IEEE® 802.11ac 2.0 IEEE 802.11n version 2.0 IEEE 802.11n 256#QAM IEEE 802.11g, IEEE 802.11b 2.4 GHz IEEE 802.11n, IEEE 802.11a 5.0 GHz
Maximum computers per wireless network	Limited by the amount of wireless network traffic generated by each node (typically 50-70 nodes)
2.4 GHz operating frequency range	2.412-2.462 GHz (US) 2.412-2.472 GHz (Europe ETSI)
5 GHz operating frequency range	5.18-5.24 + 5.745-5.825 GHz (US) 5.18-5.24 GHz (Europe ETSI)
802.11 security	WPA2-PSK [AES], WPA-PSK [TKIP] + WPA2-PSK [AES], and WPA/WPA2 Enterprise
